A numerical experiment has been conducted to test the sensitivity of a global general circulation model to changes in sea-ice extents in the Antarctic during winter. Three 112-day integrations have been made in which all the antarctic sea-ice poleward of 66 S was removed, commencing on 10 June in the second, third and fourth years of a control integration. There was a large increase in sensible heat flux over the anomaly, a warming over the Antarctic confined to the lowest atmospheric layer, and a 2 m/s reduction in the westerly flow around the periphery of the (new) sea-ice margin, in broad agreement with a previous study. The increased heating over the anomaly was accompanied by a decrease in surface pressure which was not found earlier and possible explanations of this discrepancy are considered. The results are related to previous work on the effect of increased CO2 using prescribed changes in sea surface temperature and sea-ice extents. The implications of the results for the parametrization of the heat flux through sea-ice cover, and for coupled ocean-atmosphere models are discussed. (Auth.)

Boutron, C.F., Patterson, C.C., **Lead concentration changes in antarctic ice during the Wisconsin/Holocene transition,** *Nature,* Sep. 18, 1986 323(6085), p.222-225, 41 refs. A corrigendum appears in Nature 326(6113): 626, Apr. 9, 1987.

In order to assess current global lead atmospheric pollution, it is necessary to reconstruct the natural, pre-human atmospheric fluxes of this toxic heavy metal. The time variations of these fluxes over the past 27,000 years have been obtained from the analysis of an antarctic ice core. Lead levels are found to have been high during the late Wisconsin and very low during the Holocene. Lead levels from dust, from volcanoes and from sea spray, respectively, are also assessed.

Friedli, H., **Ice core record of the C-13/C-12 ratio of atmospheric CO2 in the past two centuries,** *Nature,* Nov. 20, 1986 324(6094), p.237-238, 18 refs.

The release of carbon into the atmosphere due to the activities of humans has caused an increase in concentration as well as a change in the isotopic composition of atmospheric carbon dioxide. CO2 derived from fossil fuel combustion and from biomass destruction have *delta*C-13 values of -25 per mill (compared to the atmospheric value of -7 per mill) and are thus depleted in C-13. *Delta*C-13 of CO2 separated from air trapped in bubbles in ice samples from an ice core taken at Siple Station in Antarctica, was measured. It has been possible to demonstrate the atmospheric increase of CO2 and methane with high time resolution. The isotopic results, together with the CO2 record from the same ice core, yield information on the sources of excess carbon dioxide and provide a data base for testing the consistency of global carbon cycle models. Mokhov, I.I., **Analysis of annual course of zonal temperature field of the troposphere and lower stratosphere of the Southern Hemisphere,** *Soviet meteorology and hydrology,* 1986 No.1, p.17-23, For Russian original see 15I-33806. 6 refs.

Based on a special method of amplitude-phase characteristics, the annual course of the zonal temperature regime of the troposphere and lower stratosphere of the Southern Hemisphere is analyzed. Identified are the space-time features of the thermal structure of different latitude zones from the surface to an altitude of 21 km. The dynamics of the temperature regime of the atmosphere in the annual course differ substantially for the Southern and Northern hemispheres. Noted is the special role of the region related to the "roaring forties," which blocks the mutual influence of Antarctica and equatorial latitudes; the feature of the deep penetration of the thermal effect of the stratosphere into the troposphere south of the boundary of the tropical tropopause; and the features of the spring and autumn temperature dynamics in the vicinity of the antarctic tropopause.

Polian, G., Lambert, G., Ardouin, B., Jegou, A., **Long-range transport of continental radon in subantarctic and antarctic areas,** *Tellus,* July-Sep. 1986 38B(3-4), p.178-189, 28 refs.

Gaseous Rn-222, a daughter product of U-238, is injected into the atmosphere from the surface of continents. Its atmospheric cycle is particularly simple since it disappears only by radioactive decay (half-life 3.8 days). Radon measurements obtained over more than 15

years in remote stations in antarctic and subantarctic areas generally give concentrations as low as 0.1 to 2 pCi/cu m. However, it is shown that sharp increases of concentrations occur, reaching 3 to 30 pCi/cu m, called "radonic storms". Owing to the negligible degassing of radon from the sea surface, such peaks are accounted for by long-range transport from remote continents (mainly South Africa) over southern Indian and antarctic oceans, with transit times ranging from 1.5 to 7 days and very low dilution factors of the order of 3 to 7. This air-mass transport is related to warm sectors of cyclonic systems passing over South Africa and around the Antarctic continent. (Auth.)

Hogan, A.W., **Aerosol exchange in the remote troposphere,** *Tellus,* MP 2180, July-Sep. 1986 38B(3-4), p.197-213, 35 refs.

Parameters observed and reported here are primarily ozone mixing ratios; maximum and minimum ozone amounts noted near the ITCZ; antarctic aerosol concentrations and transport. Uniform aerosol concentrations were observed in the Antarctic troposphere, except in the vicinity of cirrus layers aloft, and in moist or cloudy layers near the surface. Enhanced ozone mixing ratios occurred in troughs about the periphery of Antarctica, and in slightly turbulent layers near mountains. Ozone and aerosol concentrations observed over a wide geographic area of Antarctica were stratified into two altitude classes, and the results mapped. Ozone concentrations in the mid troposphere (550 to 400 mb levels) were small and nearly invariant over the interior of Antarctica. Ozone concentrations in the upper tropospheric (400-300 mb) layers varied greatly, and became quite large over troughs and about the periphery of Antarctica, and in the vicinity of high mountains. Ozone exchange appears quite vigorous in the upper troposphere and frequent aerosol exchange occurs in the lower troposphere, but the stability of the middle troposphere inhibits mixing among these levels. Vertical profiles of aerosol concentration indicate an aerosol decrease of 25 particles/cu cm/Km in clear air over Antarctica. Moist and/or cloudy air over and near the Ross and Weddell Seas is enhanced with aerosols relative to this dry profile. Moist layers over the interior of Antarctica are also enhanced in aerosol concentration in comparison with dry antarctic air. (Auth. mod.)

Bodhaine, B.A., **Aerosol measurements at the South Pole,** *Tellus,* July-Sep. 1986 38B(3-4), p.223-235, 34 refs.

NOAA operates an atmospheric monitoring observatory at Amundsen-Scott Station, South Pole, where long-term measurements of carbon dioxide, ozone, aerosols, and other background pollutants are obtained to understand their possible effects on the earth's climate. The aerosol measurement program consists of the continuous measurement of condensation nuclei (CN) concentration and aerosol scattering extinction coefficient. A nearly continuous record of South Pole CN measurements from 1974 to the present, and aerosol scattering extinction coefficient measurements from 1979 to the present, has now been accumulated. The CN data show an annual cycle with a maximum exceeding 100/cu cm in the austral summer and a minimum of about 10/cu cm in the winter. Aerosol scattering extinction coefficient data show an annual cycle markedly different from that of CN with a maximum in late winter, a secondary maximum in summer, and a minimum in May. Angstrom exponents calculated from the multiwavelength aerosol scattering extinction coefficient data show a strong annual cycle suggesting larger particles in the winter than in the summer. (Auth.)

Legrand, M.R., Delmas, R.J., **Relative contributions of tropospheric and stratospheric sources to nitrate in antarctic snow,** *Tellus,* July-Sep. 1986 38B(3-4), p.236-249, 46 refs.

On the basis of some 500 firn samples from a number of antarctic sites it is shown that nitrate is deposited as gaseous HNO3 and that tropospheric sources dominate in Antarctica. Continental and anthropogenic nitrates are not significant contributors. It is suggested that lightning at tropical and/or mid latitudes is the most likely source of antarctic nitrate. The formation of HNO3 (or its precursors) in the stratosphere is discussed and the possible evidence for this contribution in several profiles is carefully investigated. The absence of a convincing correlation between solar factors and nitrate concentrations in snow confirms that past solar activity fluctuations cannot be reconstructed from polar ice cores. The spatial and temporal variations observed in this study are, however, not fully explained. Finally, emphasis is placed on the necessity of undertaking HNO3 measurements in the antarctic atmosphere in order to elucidate the deposition mechanism of this major component of atmospheric chemistry. (Auth.)

Penkett, S.A., Jones, B.M.R., Rycroft, M.J., Simmons, D.A., **Interhemispheric comparison of the concentrations of bromine compounds in the atmosphere,** *Nature,* Dec. 12, 1985 318(6046), p.550-553, 16 refs.

At least seven organic bromine compounds have been positively identified in the atmosphere and others have been observed in coastal seawater samples. The atmospheric chemistry of bromine compounds has considerable consequence in the stratosphere, where bromine acts as a more efficient catalyst than chlorine in removing ozone. Several bromine compounds also fulfil an important role in the geochemical cycling of the element through the troposphere. Here are presented measurements of four bromine compounds (CF3Br, CH3Br, CH2Br2 and CHBr3) over a large latitudinal range (40N to 75S). These data suggest that the major source of bromine in the atmosphere could be bromoform (CHBr3), probably emitted from the ocean and with a short lifetime due to photolysis. The data also suggest that the major emission of methyl bromide (CH3Br), and hence most bromine entering the stratosphere, will be anthropogenic.

Bennett, T.J., Jr., Hunkins, K., **Atmospheric boundary layer modification in the marginal ice zone,** *Journal of geophysical research,* Nov. 15, 1986 91(C11), p.13,033-13,044, 38 refs.

A case study of the Andreas et al. (1984) data on atmospheric boundary layer modification in the marginal ice zone is made. The Andreas et al data deals with the boundary layer, drag, and surface heat flux in the marginal ice zone of the Antarctic. A two-dimensional, multilevel, linear model with turbulence, lateral and vertical advection, and radiation is proposed. Good agreement between observed and modeled temperature cross sections is obtained. In contrast to the hypothesis of Andreas et al., the air flow is found to be stable to secondary circulations. Adiabatic lifting and, at long fetches, cloud top longwave cooling, not an air-to-surface heat flux, dominate the

cooling of the boundary layer. The accumulation with fetch over the ice of changes in the surface wind field is shown to have a large effect on estimates of the surface wind stress. It is suggested that the Andreas et al. estimates of the drag coefficient over the compact sea ice are too high. (Auth.)

Jones, P.D., Raper, S.C.B., Wigley, T.M.L., **Southern Hemisphere surface air temperature variations: 1851-1984,** *Journal of climate and applied meteorology,* Sep. 1986 25(9), p.1213-1230, 27 refs.

A new compilation of monthly mean surface air temperature data for the Southern Hemisphere for 1851-1984 is presented based on land-based meteorological station data. Where possible, the station data used in the analysis have been assessed for homogeneity. Only reliable or corrected station data have been used in calculating area averages. Grid point temperature estimates have been made by interpolating onto a 5 deg by 10 deg long grid for each month of the 134 years. For the period of best data coverage, 32% of the area of the Southern Hemisphere is covered. The reliability of hemispheric estimates is assessed for earlier periods when coverage is less than this maximum. Year-to-year estimates are considered reliable back to about 1890 and earlier estimates can indicate trends back to the 1860s. This new hemispheric compilation is compared with estimates of Southern Hemisphere marine data, and comparisons between land and marine data for both hemispheres are made and interpreted. The data show a long-term warming trend amounting to about 0.5 deg C over the past 100 years. The 1938-65 cooling trend that is so evident in the Northern Hemisphere data shows up only as a hiatus in the long-term warming of the Southern Hemisphere, pointing towards some hemispherically specific causal mechanism. Antarctic surface temperatures are used sporadically from 1851-1956, but the full range of antarctic data was available and utilized from 1957 through the end of the study. (Auth. mod.)

Barry, R.G., **Possible CO2-induced warming effects on the cryosphere,** Climatic changes on a yearly to millennial basis. Second Nordic Symposium on Climatic Changes and Related Problems, Stockholm, Sweden, May 16-20, 1983. Edited by N.-A. Mörner and W. Karlén, Dordrecht, D. Reidel, 1984, p.571-604, Refs. p.593-604.

DLC QC884.2.C5C575

This study updates preliminary assessments, in earlier studies, of the possible impacts of projected climatic perturbations on global snow and ice cover. It also attempts to develop a composite picture from modelling results, analytical projections, and analogs based on other warm climatic intervals. Components of global ice and snow cover—area, volume, and sea level equivalent—are tabulated, showing that 10% of the antarctic ice is in West and 90% in East Antarctica. It is suggested that possible changes in ice sheet accumulation rates should be monitored at regular intervals for large-scale transects across key areas in Antarctica and Greenland using satellite laser altimetry.

Flohn, H., **Climatic belts in the case of a unipolar glaciation,** Climatic changes on a yearly to millennial basis. Second Nordic Symposium on Climatic Changes and Related Problems, Stockholm, Sweden, May 16-20, 1983. Edited by N.-A. Mörner and W. Karlén, Dordrecht, D. Reidel, 1984, p.609-620, Refs. p.618-620.

DLC QC884.2.C5C575

The spatially different history of the large continental ice caps of Antarctica and Greenland and of the Arctic and Antarctic ice are reviewed, and evidence for the unipolar glaciations is presented. The changes in the land-sea pattern and mountain height since that time, involving changes in oceanographic circulations, such as the development of the cold Labrador Current and the evolution of the large monsoon system, are reviewed. An attempt is made to estimate the climatic zonation of a unipolar glaciated Earth whereby the different heat budget terms are evaluated and extrapolated to conditions of unipolar glaciation, including extrapolation of the tropospheric lapse rate above an ice free Arctic Ocean and a final estimation of the shift of the climatic belts. The semiempirical results obtained are shown to be, in principle, coherent with the model results of the GFDL group.

Crutzen, P.J., Arnold, F., **Nitric acid cloud formation in the cold antarctic stratosphere: a major cause for the springtime 'ozone hole',** *Nature,* Dec. 25, 1986 324(6098), p.651-655, 29 refs.

A chemical mechanism is proposed for the formation of the ozone hole. It involves removal of gaseous odd nitrogen by ion- and/or aerosol-catalysed conversion of N2O5 and ClONO2 to HNO3 vapor, followed by heteromolecular HNO3-H2O condensation, leading to HNO3-H2O aerosols. At an altitude of 17 km, these processes start at temperatures below 205 K, well above the condensation temperature of pure water vapor. We propose that the absence of gaseous odd nitrogen and catalytic methane oxidation reactions driven by sunlight in early spring lead to large OH concentrations which rapidly convert HCl to ClOX. Catalytic reactions of ClOC and BrOX cause drastic ozone destructions and can account for the springtime 'ozone hole'. By our model the depletion would be mainly due to emissions of industrial organic chlorine compounds. Arctic regions may also become affected. The depletion lasts while HNO3, but not HCl, is incorporated in the particles in the temperature range 205 K to 192 K. (Auth. mod.)

Maeda, K., Heath, D.F., **Asymmetries of the upper stratospheric ozone distribution between two hemispheres,** *Journal of the atmospheric sciences,* May 1983 40(5), p.1353-1359, 21 refs.

Based on the Nimbus-7 solar backscattered UV-radiation (SBUV) data which are free from the instrumental background noise produced by magnetospheric particles, southern winter hemispheric ozone densities in the upper stratosphere are nearly 20% higher than their counterparts in the Northern Hemisphere; *i.e.,* the ozone mixing ratios at the 1.5 mb (45 km) level are 10.2 micro g/g at 60 S in July 1979 versus 8.5 micro g/g at 60 N in December 1979. This is in significant contrast to the well-known hemispheric asymmetry of the total ozone content which is higher in the northern hemispheric winter than in the southern hemispheric winter. Comparisons of those findings with the previously obtained similar results from the Nimbus-4 backscattered UV radiation (BUV) experiment have manifested that the dark-current effect on the latter was negligible. Therefore, using the stratospheric temperature observed by selective chopper radiometer (SCR) simultaneously with the BUV experiments on the Nimbus-4 for 1970 and 1972, the cause of these asymmetries due to temperature dependent photochemistry is examined. The results are discussed. (Auth. mod.)

Steele, H.M., Hamill, P., McCormick, M.P., Swissler, T.J., **Formation of polar stratospheric clouds,** *Journal of the atmospheric sciences,* Aug. 1983 40(8), p.2055-2067, 43 refs.

Measurements of the stratospheric aerosol by SAM II during the northern and southern winters of 1979 showed a pronounced increase in extinction on occasions when the temperature fell to a low value (below 200 K). In this paper the correlation between extinction and

temperature is evaluated from thermodynamic considerations. As the temperature falls, the hygroscopic aerosols absorb water vapor from the atmosphere, growing as they do so. The effect of the temperature on the size distribution and composition of the aerosol is determined, and the optical extinction at 1 micron wavelength is calculated using Mie scattering theory. Theoretical predictions of the change in extinction with temperature and humidity are compared with the SAM II results at 100 mb, and the water vapor mixing ratio and aerosol number density are inferred from these results. A best fit of the theoretical curves to the SAM II data gives a water vapor content of 5-6 ppmv, and a total particle number density of 6-7 particles/cu cm. (Auth.)

Kolosova, N.V., **Surface wind velocity profiles in Antarctica** [O profile prizemnoĭ skorosti vetra v Antarktide], *Leningrad. Arkticheskiĭ i antarkticheskiĭ nauchno-issledovatel'skiĭ institut. Trudy,* 1981 Vol.370, p.55-62, In Russian. 13 refs.

DLC G600.L4

Results of analyses of wind velocity, measured at two levels at Vostok and Mirnyy stations, are presented. It is shown that on the coast, where katabatic winds prevail throughout the year, the differences of the mean wind velocity values at the boundaries of the 6-8 m layer above surface agree well with logarithmic law of wind velocity changes with height. Over the Antarctic Plateau which is characterized by constant large-scale inversions, the wind velocity profile is closer to an exponential correlation. It is shown that the most stable relationships occur in summer, the least stable ones during the transition seasons.

DLC QC879.7.G74 1984

Atmospheric ozone plays a significant role in the heat balance of the stratosphere. Its behavior at high latitude is of special interest since stratospheric ozone at high latitude is thought to be transported from lower latitude through dynamic processes. However, knowledge so far is limited because ozone data at high latitude are sparse. There are only two ozone stations operating in Antarctica: Showa Station (69 S) and Amundsen-Scott (90), where the total ozone has been observed in sunlit months only. To make up this deficiency ex-

tensive observations were carried out at Showa Station as a part of the international project of Middle Atmosphere Program (MAP). This paper gives some preliminary results of this observation. (Auth.)

Belmont, A.D., **Time-periodic variations in ozone and temperature,** Ozone Symposium, Halkidiki, Greece, Sep. 1984. Proceedings. Edited by C.S. Zerefos and A. Ghazi, Dordrecht, D. Reidel Publishing Co., 1985, p.300-304.

DLC QC879.7.G74 1984

The variations in zonal mean ozone and temperature from 30-60 km are compared, with emphasis on annual and semi-annual periods. Seven years of data from Nimbus 4 and 5 BUV and SCR instruments are used to prepare altitude-latitude diagrams of amplitude and phase. There are two high-latitude equinoctial semi-annual waves at 40 km, whose cause is apparently the overlap of two annual waves. Temperature and ozone are in phase near 5 mb or below, and out-of-phase near 2 mb and above. The thickness and altitude of the transition zone between them varies greatly with latitude and time, as shown by daily correlation patterns. Charts included in the paper extend the data to about 70S. (Auth.)

Bowman, K.P., **Global climatology of total ozone from the NIMBUS-7 total ozone mapping spectrometer,** Ozone Symposium, Halkidiki, Greece, Sep. 1984. Proceedings. Edited by C.S. Zerefos and A. Ghazi, Dordrecht, D. Reidel Publishing Co., 1985, p.363-367, 1 ref.

DLC QC879.7.G74 1984

A global climatology of total column ozone was computed from four years of daily observations by the Total Ozone Mapping Spectrometer (TOMS) aboard the NIMBUS-7 satellite. The precision of the TOMS retrievals with respect to well-maintained Dobson instruments is 2%. The TOMS retrievals average 6% lower than the Dobson measurements. The bias is largely explained by differences in the ozone absorption coefficients used with the different instruments. Global maps of the time-mean total ozone and the amplitude, phase, and fraction of the variance explained by the annual and semiannual harmonics were prepared. Similar analyses of the zonal-mean total ozone were carried out. Maps included with this paper extend in the antarctic regions. (Auth.)

DLC QC879.7.G74 1984

Continuous observation of ozone near the surface at the four Geophysical Monitoring for Climatic Change (GMCC) observatories over the past ten years reveals important characteristics of the ozone variability of the troposphere. An observational record of this length not only gives information on the diurnal, day-to-day and seasonal variations, but also is sufficient to analyze long term trends. Ozonesonde observations are used to judge the representativeness of the near surface observations as indicators of tropospheric ozone behavior. Amundsen-Scott Station observatory is one of the four for which ozone measurements are included and analyzed. (Auth.)

Bowman, K.P., **Interannual variability of total ozone during the breakdown of the antarctic circumpolar vortex,** *Geophysical research letters,* Nov. 1986 13(12), p.1193-1196, 14 refs.

Data from the Total Ozone Mapping Spectrometer (TOMS) on the Nimbus 7 satellite are compared with Dobson spectrophotometer measurements from the Antarctic, where a large decrease in Oct. total ozone has been observed over the last decade. It has been hypothesized that the decrease is caused by local photochemical effects of man-made chlorofluorocarbons. The TOMS data, which start in 1978, agree well with the Dobson data, confirming the low values of recent years. However, during the Southern Hemisphere spring, total ozone in the Antarctic is strongly affected by transport associated with the breakdown of the stratospheric vortex. The strength and timing of the vortex breakdown are highly variable and can have a large effect on monthly-mean total ozone values. The TOMS data suggest that variations in the stratospheric circulation have contributed to the long-term decrease. Large variations in total ozone are not confined to the Antarctic. Zonal-mean ozone values have also decreased in the Northern Hemisphere spring during the TOMS observing period. (Auth.)

Gardiner, B.G., Shanklin, J.D., **Recent measurements of antarctic ozone depletion,** *Geophysical research letters,* Nov. 1986 13(12), p.1199-1201, 2 refs.

Measurements of total ozone at Halley Bay are presented for the 6 most recent observing seasons, 1980-86, showing the consistency and progress of the spring ozone depletion. The principal ozone minimum of Oct. 1985 was as deep as that of 1984, if not deeper. However, the period of depletion was affected by strong wave activity, giving rise to 4 distinct minima. A cusped maximum in total ozone was observed at Halley Bay on Oct. 19, 1985, confirmed by temperatures in the lower stratosphere and by a similar ozone maximum at Faraday Station. In the presence of such fluctuations, it is not possible to say whether the ozone depletion has reached its limit or not; indeed several years' data will yet be needed before that question can be answered. Ozone amounts recorded in the summer period Dec. 1985 to Feb. 1986 remain marginally lower than in the past. (Auth.)

Sekiguchi, Y., **Antarctic ozone change correlated to the stratospheric temperature field,** *Geophysical research letters,* Nov. 1986 13(12), p.1202-1205, 4 refs.

Total ozone and ozonesonde data, obtained at Showa Station, are analyzed together with radiosonde data in the lower stratosphere. Very high correlation coefficients between monthly mean values of ozone and stratospheric temperature suggest a clear relation between

stratospheric circulation and ozone amount. The rapid decrease of the antarctic ozone in recent years might be caused by the extraordinary change in the circulation. A rapid decrease of the temperature in the lower stratosphere above Showa Station, in spring months of recent years is noted. This conclusion is endorsed by analysis of ozonesonde observations in 1982. The year-to-year change of both total ozone and stratospheric temperature suggests the influence of changes in solar activity. (Auth.)

Newman, P.A., Schoeberl, M.R., **October antarctic temperature and total ozone trends from 1979-1985,** *Geophysical research letters,* Nov. 1986 13(12), p.1206-1209, 11 refs.

The morphology of temperature trends in the south polar stratosphere from 1979-1985 is detailed. A significant cooling has occurred in the stratosphere over this period. South polar Oct. mean temperatures have declined 18 K at 24 km over the seven year period. A large fraction of this decline occurs as a result of including 1979 temperatures in the trend. The years 1979 and 1982 differ from other years in that they include large mid-Oct. wave events which produce significantly warmer polar temperatures. Nevertheless, a significant temperature decline has still occurred in the stratosphere even when the dynamically active years are not included. Comparing two relatively dynamically quiet years, 1980 and 1985, the largest temperature decrease in the 30 mb temperature field occurs not at the pole but in the sub-polar temperature maximum centered near 60 S. The changes in temperature of both the maximum and the polar low regions correlate fairly well with total ozone changes observed by TOMS. (Auth.)

Stolarski, R.S., Schoeberl, M.R., **Further interpretation of satellite measurements of antarctic total ozone,** *Geophysical research letters,* Nov. 1986 13(12), p.1210-1212, 13 refs.

Both dynamical and chemical mechanisms have been advanced to explain the decrease in total ozone in the antarctic spring. Further analysis of satellite measurements show that during any one year the Sep. decline in total ozone near the South Pole is compensated by an increase at mid-latitudes. The total ozone amount from 44 S to the pole remains almost unchanged from Aug. through Nov. even though both the polar and mid-latitude values reach extremes during this period. These observations suggest that the variations within the spring season in south polar total ozone are governed by dynamical redistribution rather than chemical processes. (Auth.)

McPeters, R.D., Hudson, R.D., Bhartia, P.K., Taylor, S.L., **Vertical ozone distribution in the antarctic ozone minimum measured by SBUV,** *Geophysical research letters,* Nov. 1986 13(12), p.1213-1216, 5 refs.

The ozone profiles measured by SBUV in the region of the antarctic ozone minimum are in error as archived for altitudes below the 7 mb level in the atmosphere because of the lack of a reasonable climatology to use for the initial guess profile. The ozone profile error in this region is examined and it is shown that use of a reasonable climatology in this unusual region results in ozone profiles that agree substantially better with the balloon observations available from Showa Station. The corrected profiles show that by 1984 there was 35% less ozone in the 15 to 30 km region than in 1979, and 14% less even in the 40 to 50 km region. (Auth.)

Schoeberl, M.R., Krueger, A.J., Newman, P.A., **Morphology of antarctic total ozone as seen by TOMS,** *Geophysical research letters,* Nov. 1986 13(12), p.1217-1220, 6 refs.

A more detailed examination of the TOMS observations reveals a number of important aspects of the antarctic ozone depletion. First, it is noted that the presence of large scale disturbances around the edge of the ozone hole can lead to highly variable station observations. Second, an examination of the zonal mean total ozone for seven octobers shows that the large systematic decline is not simply confined to the polar region but exists at mid-latitudes as well. Integrations of the total ozone from the South Pole northwards show that a portion of the systematic trend of decreasing antarctic total ozone (prior to 1985) seems to be due to a redistribution of total ozone to subpolar and mid-latitude regions. That is, decreases at high latitudes are compensated by increases at lower latitudes. The correlation between zonal mean total ozone and 70 mb zonal mean temperatures from polar to mid-latitudes shows that the systematic decrease in total ozone is well correlated with a systematic decrease in stratospheric temperatures. Chubachi, S., **On the cooling of stratospheric temperature at Syowa, Antarctica,** *Geophysical research letters,* Nov. 1986 13(12), p.1221-1223, 9 refs.

Strong cooling is observed from 1974 to 1985 of the 100 mb temperature in Nov. at Showa Station. Similar cooling is also seen in other pressure levels (70, 50, and 30mb levels) and other months. The rate of change for each month is very similar to the one of total amount of ozone at Showa. A simple model is proposed which links ozone and temperature decrease in Antarctica. (Auth.)

Chandra, S., McPeters, R.D., **Some observations on the role of planetary waves in determining the spring time ozone distribution in the Antarctic,** *Geophysical research letters,* Nov. 1986 13(12), p.1224-1227, 10 refs.

Ozone measurements from 1970 to 1984 from the Nimbus 4 backscattered ultraviolet (SBUV) spectrometers show significant decrease in total ozone only after 1979. The downward trend is most apparent in Oct. south of 70 S in the longitude zone 0 to 30 W where planetary wave activity is weak. Outside this longitude region, the trend in total ozone is much smaller due to strong interannual variability of wave activity. This paper gives a phenomenological description of ozone depletion in the antarctic region based on vertical advection and transient planetary waves. (Auth.)

Newman, P.A., **Final warming and polar vortex disappearance during the Southern Hemisphere spring,** *Geophysical research letters,* Nov. 1986 13(12), p.1228-1231, 10 refs.

Seven years (1979-1985) of NMC data are used to analyze Southern Hemisphere middle stratosphere winter-to-summer circulation transitions. These transitions are classified into two extreme categories: a mid-Oct. wave event (1979 and 1982), and a mid-Nov. final warming with no strong Oct. wave event (1980-1981). After the final warming a wave event in late Nov.-early Dec. results in the disappearance of the polar vortex. All of these wave events in conjunction with zonal mean mass motions act to reduce zonal mean gradients of potential vorticity and ozone through horizontal mixing, and hence they act to destroy the vortex and fill the ozone hole. Additionally, it is noted that the final warming and the vortex breakdown are two distinct events separated by 15-40 days. Finally, past studies show that the time of these events has not radically changed. (Auth.)

Farrara, J.D., Mechoso, C.R., **Observational study of the final warming in the Southern Hemisphere stratosphere,** *Geophysical research letters,* Nov. 1986 13(12), p.1232-1235, 6 refs.

The final warming in the Southern Hemisphere stratosphere during the period Sep. 1-Nov. 30 for 1978-1983 is studied. The change in zonally averaged temperatures during that period is almost the same for each year. However, there is substantial interannual variability in the time evolution of the warming as events of enhanced wave, mean-flow interaction associated with bursts of upward propagating planetary waves develop at different times in different years. Polar temperatures in the middle stratosphere can increase as much as about 20 K in 4 days during these events. Such dynamical processes can play a significant role in the interannual variability of stratospheric ozone and other constituents. (Auth.)

Bojkov, R.D., **1979-1985 ozone decline in the Antarctic as reflected in ground based observations,** *Geophysical research letters,* Nov. 1986 13(12), p.1236-1239, 9 refs.

Since 1979, from late Sep. to the end of Nov., the total ozone over the southern polar region has declined by up to 30%, compared with the ozone average for 1957-78. During the rest of the year there are no indications of a major decline. Neither are there significant changes in the middle latitudes surrounding Antarctica except those related to the QBO. More than 85% of the entire ozone deficiency is observed between 10 and 24 km. The rapid ozone and temperature increase in spring usually occurs in mid Oct. and shows a 2 month lag, compared to the Arctic. The increase is related to the time of the breakdown of the winter stratospheric polar vortex. During the last 6 years the breakdown has occurred around mid-Nov., extending the period with circumpolar circulation by 3-4 weeks. It is suggested that weak upward motions within the vortex, in the order of 0.1 cm/sec during Sep. and Oct., could cause part of the ozone decline. (Auth.)

Angell, J.K., **Close relation between antarctic total-ozone depletion and cooling of the antarctic low stratosphere,** *Geophysical research letters,* Nov. 1986 13(12), p.1240-1243, 3 refs.

Nearly 5500 mean-monthly low-stratospheric temperatures at 100, 50 and 30 mb at 16 antarctic stations have been extracted from "Monthly Climatic Data for the World" for 1958-1985. About 450 mean-monthly total-ozone values at 4 antarctic stations have been extracted from "Ozone Data for the World" for the same interval. There has been an impressive in-phase relation between seasonal variations in low-stratospheric temperature and total ozone in Antarctica. This relation extends not only to the large total-ozone and low-stratospheric temperature decreases since 1978 in the Southern Hemisphere spring, but also to minor fluctuations in this and other seasons. The springtime stratospheric temperature decreases since 1978 are indicated to have been greatest along the antarctic coast between about 30 W and 60 E; there has been practically no low-stratospheric temperature decrease at stations 10 degrees of latitude further north on the Antarctic Peninsula. The springtime temperature decrease has been pretty much confined to the antarctic stratosphere, or to levels above about 300 mb. (Auth.)

I-34966
Rood, R.B., **Global ozone minima in the historical record,** *Geophysical research letters,* Nov. 1986 13(12), p.1244-1247, 19 refs.

The magnitude and structure of the global total ozone minimum between 1958 and 1962 is similar to that observed between 1979 and 1983. Analysis of the single station data that exhibit the most pronounced minima suggests that the spatial structure of the global minimum is different from the currently observed reduction. Very low north polar values were observed, but there is no indication of anomalously low ozone in Antarctica. The temporal relationship to the sunspot cycle is similar in both time periods. Rather than solar terrestrial interaction, however, a more likely explanation of the early 1960's reduction is normal climatology caused by a persistent period of planetary wave activity. Such a natural explanation may also be appropriate for the current depletion. (Auth.)

Komhyr, W.D., Grass, R.D., Leonard, R.K., **Total ozone decrease at South Pole, Antarctica, 1964-1985,** *Geophysical research letters,* Nov. 1986 13(12), p.1248-1251, 5 refs.

Mean monthly total ozone data obtained at South Pole during 1964-1985 are presented. Preliminary analysis of the data suggests that total ozone has decreased at South Pole by roughly 20% since the mid-1960's. Largest decreases have occurred during Oct. and Nov. months, but autumn and winter months also exhibit a decrease. During Feb. months, ozone has increased slightly. Superimposed on the long-term downward ozone trend are episodic decreases in ozone dating back to 1965 that have occurred at intervals of 4-6 years. These decreases are shown to be related to delays in stratospheric warmings in Antarctica and the transport of ozone into Antarctica each spring. (Auth.)

Hofmann, D.J., Rosen, J.M., Harder, J.A., Rolf, S.R., **Ozone and aerosol measurements in the springtime antarctic stratosphere in 1985,** *Geophysical research letters,* Nov. 1986 13(12), p.1252-1255, 18 refs.

Balloonborne measurements of ozone and aerosol concentrations at McMurdo Station in Nov. 1985 indicated large variations, apparently associated with movement of the polar vortex. Extremely low ozone concentrations were observed, on one occasion to altitudes in excess of 30 km. Low ozone was accompanied by the absence of optically active aerosol and an enhancement of condensation nuclei while the opposite was the case with normal ozone. The ozone measurements are consistent with a springtime antarctic vortex ozone minimum (popularly called the ozone hole) and variations in the aerosol size distribution appear to be associated with the thermal history of the relevant air parcel. Austin, J., Remsberg, E.E., Jones, R.L., Tuck, A.F., **Polar stratospheric clouds inferred from satellite data,** *Geophysical research letters,* Nov. 1986 13(12), p.1256-1259, 13 refs.

Anomalously high radiances from the ozone channel of the Limb Infra-red Monitor of the Stratosphere (LIMS) sounding instrument have been observed in the Northern Hemisphere winter lower stratosphere. Such events, thought to be due to polar stratospheric clouds (PSCs) are examined further by computing relative humidities using Stratospheric Sounding Unit (SSU) temperatures and water vapor measurements from the LIMS Map Archive Tape (MAT) analyses. Applying a similar approach to the Southern Hemisphere, in 1979, virtually no PSCs are found in the vortex after 10 Sep. at 20 km. This result has important implications for a number of proposed explanations for the Antarctic ozone hole. (Auth.)

Keys, J.G., Johnston, P.V., **Stratospheric NO2 and O3 in Antarctica: dynamic and chemically controlled variations,** *Geophysical research letters,* Nov. 1986 13(12), p.1260-1263, 11 refs.

Ground based measurements of stratospheric NO2 made from Arrival Heights are compared with TOMS satellite total ozone meas-

urements and upper air meteorological data. The observations show the seasonal effects of partitioning on NO2 and the influence of wave driven transport on both the NO2 and O3 column in spring. It is concluded that stratospheric air appearing over the site in spring during low pressure conditions is representative of the cold core of the polar vortex, which has effectively been isolated from lower latitude air. Within this core, photochemical processes influencing the ozone column amount and NO2 levels can proceed without marked influence from transport effects. (Auth.)

Shibasaki, K., Iwagami, N., Ogawa, T., **Stratospheric nitrogen dioxide observed by ground-based and balloon-borne techniques at Syowa Station (69.0S, 39.6E),** *Geophysical research letters,* Nov. 1986 13(12), p.1268-1271, 16 refs.

Seasonal variation of vertical column density of stratospheric NO2 was determined for the period Mar. 1983 to Jan. 1984 by means of ground-based visible absorption spectroscopy at Showa Station. The values obtained are nearly equal to, or a little smaller, than those observed at northern high latitudes. The nighttime decay of column density was small from autumn to early spring. A rapid increase in column density occurred at the end of Sep. before the minimum of total ozone content in mid-Oct. This behavior suggests that both dynamical and photochemical processes may be involved in the antarctic ozone depletion. In the lower stratosphere below 25 km, variability in NO2 density seems to be large due to dynamical effects. (Auth.)

McCormick, M.P., Trepte, C.R., **SAM II measurements of antarctic PSC's and aerosols,** *Geophysical research letters,* Nov. 1986 13(12), p.1276-1279, 19 refs.

Measurements by the SAM II satellite instrument show that polar stratospheric clouds (PSC's) are a regular feature of the austral winter season in either nonvolcanically or volcanically disturbed periods. The tops of these clouds are observed above 20 km in early einter and descend in altitude over the course of the season to heights near 15 km in mid Sep. Typically, PSC's persist in the lowest stratospheric altitudes throughout Sep. Subsequently, Oct. always represents a relative annual minimum in aerosol extinction above 15 km and in stratospheric column amount. In addition, volcanically produced aerosols in Antarctica peaked in early 1983 and, if linearly related to ozone losses, are probably not a contributing factor to the continued loss of total ozone in the Antarctic spring in 1984 and 1985. (Auth.)

McCormick, M.P., Larsen, J.C., **Antarctic springtime measurements of ozone, nitrogen dioxide, and aerosol extinction by SAM II, SAGE, and SAGE II,** *Geophysical research letters,* Nov. 1986 13(12), p.1280-1283, 11 refs.

Simultaneous vertical profiles of O3, NO2 and aerosol extinction obtained with the Stratospheric Aerosol Measurement II (SAM II), Stratospheric Aerosol and Gas Experiment (SAGE), and SAGE II satellite instruments across the southern polar vortex show that significant differences exist at all altitudes. Both gaseous species display lower concentrations within the vortex over measurement altitudes ranging from the tropopause to 60 km and 20 to 40 km for O3 and NO2, respectively. Aerosol extinction above 15-18 km and total aerosol stratospheric column are also lower inside the vortex than outside. Total column amounts of O3 and NO2 are found to be strongly coupled to spatial location within the vortex, with minimum total values located around the vortex center. Vertical profiles selected to emphasize the observed difference across the circumpolar vortex are presented for Oct. 13, 1981, and Oct. 13, 1985, near 70 and 68 S latitude, respectively. (Auth.)

Toon, O.B., Hamill, P., Turco, R.P., Pinto, J., **Condensation of HNO3 and HCl in the winter polar stratospheres,** *Geophysical research letters,* Nov. 1986 13(12), p.1284-1287, 18 refs.

Nitric acid and hydrochloric acid vapors may condense in the winter polar stratospheres. Nitric acid clouds, unlike water ice clouds, would form at the temperatures at which polar stratospheric clouds (PSCs) are observed and would have optical depths of the magnitude observed suggesting that HNO3 is a dominant component of PSCs. ClO, N2O5 and ClNO3 may react on cloud particle surfaces yielding additional HNO3, HCl, and HOCl. In the vicinity of PSCs these reactions could deplete the stratosphere of photochemically active NOx species. The sedimentation of PSCs may remove these materials from the stratosphere. The loss of vapor phase NOx might allow halogen-based chemistry to create the ozone hole. (Auth.)

Rodriguez, J.M., Ko, M.K.W., Sze, N.D., **Chlorine chemistry in the antarctic stratosphere: impact of OClO and Cl2O2 and implications for observations,** *Geophysical research letters,* Nov. 1986 13(12), p.1292-1295, 20 refs.

Theories have been proposed to relate the reduction of O3 during antarctic spring to catalytic cycles involving chlorine and bromine species. A necessary condition for any chlorine-catalyzed scheme is that a large fraction of the chlorine must be in the form of ClO in the lower stratosphere. It has been suggested that these high levels of ClO could be maintained by fast heterogeneous reactions, whose rates are not known at present. Model calculations based on the above mechanisms predict considerable amounts of OClO and Cl2O2, particularly during the night. Results of calculations of the diurnal variations of ClO, OClO, and Cl2O2 during antarctic spring, for different cases, are presented, which suggest that coincident measurements of the total column abundance and diurnal variation of ClO and OClO may help constrain key aspects of the proposed chemical mechanisms. Removal of O3 by the catalytic cycle involving Cl2O2 could be as important as that involving BrO for present levels of chlorine, provided that Cl2O2 photolyzes rapidly to yield Cl and ClO2. It is shown

that there is no synergy between these two cycles, since they both compete for the available ClO. (Auth. mod.)

McElroy, M.B., Salawitch, R.J., Wofsy, S.C., **Antarctic O3: chemical mechanism for the spring decrease,** *Geophysical research letters,* Nov. 1986 13(12), p.1296-1299, 21 refs.

Chemical explanations for the spring decline of Antarctic O3 involve reactions of ClO or interactions between BrO and ClO. Reaction schemes involving Br radicals have the highest efficiency for removal of O3. The chemical mechanisms require low levels of NOx. Recent cooling of the stratosphere may have triggered formation of HNO3 monohydrate, removing NOx and setting the stage for enhanced loss of ozone over Antarctica. (Auth.)

Aikin, A.C., McPeters, R.D., **Meteoric material and the behavior of upper stratospheric polar ozone,** *Geophysical research letters,* Nov. 1986 13(12), p.1300-1303, 12 refs.

During spring of 1983 at 75 to 80 S the ozone mixing ratio at 1 mb decreases continuously from Sep. through the summer solstice and then increases in late summer and fall, but much less ozone was observed at 1 mb in Sep. and Oct. than under similar conditions in the fall. This asymmetry between spring and fall ozone values may be the direct result of the sudden release of chlorine bound by meteoric material during polar night. Meteoric atoms, X, descending from the mesosphere react with the atmosphere to produce XOH, which will interact with HCl to form salts, XCl. Since these processes continue in the absence of sunlight, chlorine may accumulate during polar winter. The sudden release of this chlorine from photodissociation of these salts during spring could give rise to the loss of ozone in the upper stratosphere. At 30 mb ozone decreases substantially in mid-Sep. and remains at a low value until the mid-Oct. increase. Different mechanisms may be required to explain the ozone decreases in the upper stratosphere and in the lower stratosphere. (Auth.)

Cariolle, D., Déqué, M., Morcrette, J.-J., **GCM simulation of the ozone seasonal variations at high latitudes in the Southern Hemisphere,** *Geophysical research letters,* Nov. 1986 13(12), p.1304-1307, 15 refs.

A General Circulation Model is used to simulate the O3 seasonal variations in the Southern Hemisphere at high latitudes. The model reproduces many features of the stratospheric circulation and the ozone distribution. In particular a very cold and intense polar vortex develops from mid-winter through spring and lasts until early Nov. The ozone content is minimum in the polar vortex, below 300 Dobsons, in spring. This value is still significantly higher than the amounts near 200 Dobsons recently measured in several Dobson stations in Antarctica. The possible deficiencies of the model photochemistry responsible for this discrepancy are discussed. The rapid polar ozone increase which follows the final warming is fairly well reproduced by the model. The warming starts in early Nov. and is associated with an increase of the planetary wave 1 amplitude beyond 60 S. The polar vortex follows a westward trajectory which starts from the pole and crosses over the Argentine Is. before vanishing at midlatitudes, in good agreement with observations. (Auth.)

Tung, K.K., **On the relationship between the thermal structure of the stratosphere and the seasonal distribution of ozone,** *Geophysical research letters,* Nov. 1986 13(12), p.1308-1311, 12 refs.

An attempt is made to put the phenomenon of antarctic ozone hole in a global perspective by pointing out that there is a much larger and more persistent hole over the tropics. The thermal structure of the antarctic lower stratosphere in winter is more similar to the tropical lower stratosphere than the Arctic lower stratosphere in winter. The dynamical transport that is responsible for creating the two column ozone minima has similar relationship to the thermal structure in the lower stratosphere in the two regions. (Auth.)

Mahlman, J.D., Fels, S.B., **Antarctic ozone decreases: a dynamical cause?,** *Geophysical research letters,* Nov. 1986 13(12), p.1316-1319, 11 refs.

A hypothesis is advanced that natural dynamical processes might explain much of the observed late winter ozone decreases over Antarctica. For this to be the case, sometime after 1979 there must have been a substantial reduction of the wintertime planetary-scale disturbance activity in the Southern Hemisphere troposphere. The expected stratospheric response to such a natural process is to reduce wintertime polar ozone, prolong the life of the polar vortex, reduce the transport of ozone put out of the middle stratosphere, and increase the possibility of polar rising motion shortly after the return of the sun to high latitudes. All of these effects are in qualitative agreement with the observed ozone changes. (Auth.)

Pyle, J.A., **Large ozone losses in Antarctica: the role of heating perturbations,** *Geophysical research letters,* Nov. 1986 13(12), p.1320-1322, 9 refs.

Using a two-dimensional circulation model the possible influence on the polar ozone column of modifications to lower stratospheric heating rates, both within the polar vortex and in middle latitudes, has been examined. Using reasonable heating rates it is not possible to change the model ozone to reproduce observed ozone losses in Antarctica. If an additional model heating is introduced at, or just before, the end of the Southern Hemisphere polar night, the time scales are such that appreciable ozone changes do not occur for at least three months. (Auth.)

Evans, W.F.J., Boville, B.W., McConnell, J.C., Henderson, G.S., **Simulation of antarctic ozone with chemical and dynamical effects,** *Geophysical research letters,* Nov. 1986 13(12), p.1323-1326, 16 refs.

Several numerical 1-D model experiments were conducted in an attempt to simulate the behavior of antarctic O3 throughout the year and in particular to account for the observed downward trend of O3 in Oct. The vertical and horizontal transports were parameterized by a vertical formulation. It is found that the observed low Oct. O3 can be simulated by an increase in the intensity of the vertical transport in the polar night and early spring or by a delay in the transition from the winter to summer thermal regimes. In addition, the effect of atmospheric transports on the total O3 is shown to be important throughout the year. It is suggested that dynamical changes in the winter vortex, possibly caused by stratospheric cooling due to the greenhouse effect, may be even more important than photochemical changes in the striking enhancement of the antarctic O3 hole. (Auth.)

Isaksen, I.S.A., Stordal, F., **Antarctic ozone depletion: 2-D model studies,** *Geophysical research letters,* Nov. 1986 13(12), p.1327-1330, 12 refs.

Antarctic ozone depletion is estimated in a 2-D global model as a result of increase in chlorine levels from 1 ppb to 2.7 ppb and an increase in bromine levels from 15 ppt to 30 ppt. The adopted increase is assumed to be the anthropogenic influence on the stratospheric concentrations of chlorine and bromine species in 1985. Heterogeneous formation of ClO from the reaction between ClONO2 and HCl is included in the calculations, hypothesizing this is the dominant reaction path for chlorinated species on particle surfaces. A total ozone depletion as high as 14-20% may have occurred during the month of Oct. at 80 S when maximum depletion is obtained. Both the magnitude and the time period when the maximum depletion occurs, agree with observed depletion over the last 8 years. (Auth.)

Shine, K.P., **On the modelled thermal response of the antarctic stratosphere to a depletion of ozone,** *Geophysical research letters,* Nov. 1986 13(12), p.1331-1334, 14 refs.

Simple models are used to investigate the effect of a spring-time depletion of ozone in the Antarctic on stratospheric temperatures It is shown that coolings in excess of 5 K are possible in the lower stratosphere. No evidence for such changes exists. One possible mechanism that could offset this cooling involves the loss of water vapor from the lower stratosphere due to desiccation processes associated with polar stratospheric clouds. (Auth.)

Shi, G., Wang, W.-C., Ko, M.K.W., Tanaka, M., **Radiative heating due to stratospheric aerosols over Antarctica,** *Geophysical research letters,* Nov. 1986 13(12), p.1335-1338, 18 refs.

The 1982 balloon measurements of temperature, ozone, humidity, and ground-based measurements of turbidity at Showa Station are used to study the solar and thermal radiative effects due to gases and aerosols. Calculations indicate that, with the observed temperature, the thermal radiative cooling due to CO2 and O3 emissions yield a net radiative cooling in the lower stratosphere throughout the year, if the effects of aerosols are excluded. The aerosols play an important role in the long-wave radiation by providing a thermal heating from Mar. to Sep. During the winter months the thermal heating almost compensates for the cooling due to CO2 and O3 emissions resulting in a near radiative equilibrium state. This sets the stage for a net radiative warming in spring from absorption of solar energy, which may provide energy for an upwelling motion responsible for the ozone hole. (Auth.)

Rosenfield, J.E., Schoeberl, M.R., **Computation of stratospheric heating rates and the diabatic circulation for the antarctic spring,** *Geophysical research letters,* Nov. 1986 13(12), p.1339-1342, 13 refs.

A radiative transfer model is used to compute the net heating and diabatic circulation from observed temperature and ozone data in the Southern Hemisphere during Sep. and Oct. of 1979, 1980, and 1984. There is an increase in net heating near the pole which is associated with an upward cell in the diabatic circulation. This is consistent with dynamical theories of the observed intraseasonal changes in total ozone which postulate the development of an upward circulation at the pole. However, estimates of the mass circulation at the pole suggest that an additional heat source of at least 0.5 K/day is required to maintain the upward cell. Increased net heating at the pole from 1979 to 1980 and decreased net cooling at mid to subpolar latitudes from 1979 to 1984 is also found, which suggests a trend toward increased upward circulation at the poles and downward motion at midlatitudes consistent with the observed changes in total ozone. Hatakeyama, S., Leu, M.-T., **Reactions of chlorine nitrate with HCl and H2O,** *Geophysical research letters,* Nov. 1986 13(12), p.1343-1346, 13 refs.

The kinetics of the reactions of chlorine nitrate with HCl and H2O have been investigated using a static photolysis/Fourier transform infrared spectrophotometer apparatus. Upper limits for the rate constants for the homogeneous gas-phase reactions of ClONO2+HCl (1) and ClONO2+H2O (2) were estimated. The yields of HNO3 were 1.05 and 0.86, respectively. No synergistic effect between H2O and HCl was observed. The kinetic behavior of reaction (2) was well described by simple first-order kinetics while the behavior of reaction (1) was found to be well described in terms of the Langmuir adsorption isotherm. Hayman, G.D., Davies, J.M., Cox, R.A., **Kinetics of the reaction ClO+ClO—>products and its potential relevance to antarctic ozone,** *Geophysical research letters,* Nov. 1986 13(12), p.1347-1350, 18 refs.

Reaction ClO+ClO—>products has been studied by a molecular modulation technique as a function of temperature from 268 to 338 K using pressures from 2 to 700 Torr. The reaction is found to have a strong pressure dependence and to be second order under the conditions used. The data have been interpreted in terms of three pressure-independent channels and a fourth, pressure-dependent channel in which the ClO dimer is formed. The title reaction is then discussed in the light of the large ozone depletions seen in the antarctic spring. A catalytic cycle involving the ClO dimer is presented which may account for these observations. (Auth. mod.)

Friedl, R.R., Goble, J.H., Sander, S.P., **Kinetics study of the homogeneous and heterogeneous components of the HCl + ClONO2 reaction,** *Geophysical research letters,* Nov. 1986 13(12), p.1351-1354, 11 refs.

The kinetics of the reaction HCl+ClONO2—>Cl2+HNO3 were investigated at 298 K using a flow reactor with FTIR analysis to assess the importance of this reaction for stratospheric chemistry. The observed reaction was characteristic of a heterogeneous process. From calculations of the first order wall rate constant, estimates were made of the reaction rate on stratospheric aerosols. Because both HCl and ClONO2 need to be adsorbed on the particle surface, the reaction will be of negligible importance under most stratospheric conditions. (Auth. mod.)

Fleig, A.J., Bhartia, P.K., Wellemeyer, C.G., Silberstein, D.S., **Seven years of total ozone from the TOMS instrument: a report on data quality,** *Geophysical research letters,* Nov. 1986 13(12), p.1355-1358, 7 refs.

Seven years of TOMS total ozone data are currently available. Recently a new ozone retrieval algorithm based on improved ozone absorption cross section was implemented that has introduced 6-7% discontinuity in the archived data sets at the end of the 5th year of instrument operation. Until all data are reprocessed with the new algorithm, users can use a table of correction factors given in this paper to make the data set internally consistent. This paper also presents a comparison of TOMS results with Amundsen Scott Dobson station. Though the agreement in most years is good, in 1983-84 the Dobson station reported unusually high values of ozone while TOMS saw the very low ozone values associated with the antarctic ozone hole. Kodama, Y., Wendler, G., **Wind and temperature regime along the slope of Adelie Land, Antarctica,** *Journal of geophysical research,* May 20, 1986 19(D6), p.6735-6741, 26 refs.

An analysis was made of data collected from automatic weather stations (AWS) on the slope of Adelie Land. The data were collected simultaneously at different stations on the ice-covered slope of the continent, where no data have previously been obtained. The stations are classified into three groups according to their location (high plateau, intermediate plateau, or coastal region), each having distinct annual temperature and wind speed regimes. These classifications also correspond well to the stations' slopes. Change in surface air temperature along the slope with respect to height was smaller than -1 deg C/100 m between the high plateau and the intermediate plateau stations. The wind directions did not follow Ball's model, which suggests the importance of the gradient of surface potential air temperature along the slope on the wind regime. A scale analysis showed the condition in which the gradient of surface potential air temperature along the slope should not be considered negligible when considering the total pressure gradient force. This condition in turn indicates that the entrainment of momentum across the top of the katabatic wind layer is also important. (Auth.)

Oeschger, H., Stauffer, B., **Review of the history of atmospheric CO2 recorded in ice cores,** Changing carbon cycle: a global analysis, New York, Springer-Verlag, 1986, p.89-108, 38 refs.

DLC QH344.C46 1986

For the past 25 years the study of ice cores for potential insights into the history of the atmosperic CO2 concentration has received great attention from scientists interested in the reconstruction of environmental parameters. Deep ice cores from Greenland and Antarctica, which are continuous sequences of generally high-quality samples formed during the last 100,000 and 50,000 years, respectively, were available for study. Research has led to new techniques for extracting gases from ice and to recent developments of sensitive and accurate techniques for the analysis of gas. In this chapter the state of the art of this research is described. A crucial question relates to the occlusion of air in ice and to possible mechanisms leading to deviations of the gas composition of the trapped air from that of the atmosphere at the time of ice formation and during the long storage time of the air bubbles in the surrounding ice matrix. In examining these processes some of the significant factors considered are: history of the method of reconstructing atmospheric gas composition; trapping of air in natural ice; interactions between air in bubbles and surrounding ice; preindustrial atmospheric ice; CO2 sources and sinks and CO2 warming; natural regulation of atmospheric CO2 concentration; climate impact of past atmospheric CO2; and isotopic CO2 variations. Lejenäs, H., **Comparative study of Southern Hemisphere blocking during the Global Weather Experiment,** *Royal Meteorological Society, London. Quarterly journal,* Jan. 1987 113(475), p.181-188, 11 refs.

Southern Hemisphere blocking during the Global Weather Experiment has been studied. Two different data sets, and two different methods to identify blocking have been used. One data set consists of maps analyzed at the Australian Bureau of Meteorology and the other of FGGE level III-b data. The results show that one method, which tends to emphasize blocks accompanied by cut-off lows, is more sensitive to data accuracy than the other which is based on a count of persistent positive anomalies exceeding a certain threshold value. Antarctic data was analyzed in preparing the model for this study. (Auth.)

Koshel'kov, IU.P., **Revised empirical models of the stratosphere and mesosphere of the Southern Hemisphere** [Utochnennye empiricheskie modeli stratosfery i mezosfery iuzhnogo polushariia], *Antarktika; doklady komissii,* 1984 No.23, p.22-34, In Russian. 17 refs.

DLC G576.A65

Review of radiosonde and temperature rocket data obtained up to Jan. 1982 resulted in corrected empirical models of the Southern Hemisphere atmosphere, for the 25-80 km layer, which are discussed. Tabulated temperature and wind velocity values show little difference in the stratosphere between the new and the previously obtained models. In the mesosphere, however, the temperature values differ by up to 5-7 deg, and those for the wind speed by 5-10 m/s. A comparison is made with the Northern Hemisphere data, and interhemispheric differences are determined on the basis of the corrected models.

DLC G576.A65

Satellite data show a significant asymmetry of temperature fields in the stratosphere and mesosphere of the Southern Hemisphere in the cold period. The consistency of such anomalies makes it necessary to complement general models of the Southern Hemisphere atmosphere with regional ones. Mean temperature profiles for some sectors of the Southern Hemisphere, based on satellite data obtained during a period of 2-3 years, are presented, complementing general models based on rocket data. Stratospheric and mesospheric temperature differences between sectors are discussed.

Chiba, O., Kobayashi, S., **Study of the structure of low-level katabatic winds at Mizuho Station, East Antarctica,** *Boundary-layer meteorology,* Dec. 1986 37(4), p.343-355, 14 refs.

Low-level katabatic wind profiles, which have shapes similar to those of the low-level jet (LLJ) wind profiles, are often observed during strong winds in the summer period at Mizuho Station. The profiles may be classified according to the height of the maximum wind speed zm, found below 30 m height. The behavior of zm and of conditions in the layer above zm are explained well by the normalized frequency, $fN=Nz/U$ at 30 m, whose value can be used to predict the existence of a LLJ wind profile. Subsidence and inertial oscillations above zm are related closely to the height and time variations of zm. Thus, not only effects emanating upward from surface but also momentum and heat transported downward from above are significant for the evolution of zm. (Auth.)

Shaw, G.E., **On physical properties of aerosol at Ross Island, Antarctica,** *Journal of aerosol science,* 1986 17(6), p.937-945, 15 refs.

The physical characteristics of Aitken nuclei and their relation to air mass type at Ross Island are reported. The size distribution spectrum of the particles was derived with a diffusion battery and nonlinear mathematical inversion and is considered to be quite accurate over the particle diameter range $0.01<d<0.2$ micron. The Aitken nuclei concentration decreased at Ross Island by about an order of magnitude from summer to winter. Particle size varied with air mass type: maritime polar air masses had a geometric mean particle diameter larger than continental Antarctic (cA) air masse particles. The anomalously small particles associated with cA air suggests the presence of an upper tropospheric or partly stratospheric origin of nuclei perhaps associated with mixing formed by breaking waves over the Ellsworth Range in Marie Byrd Land. (Auth.)

Iwasaka, Y., **Non-spherical particles in the antarctic polar stratosphere—increase in particulate content and stratospheric water vapor budget,** *Tellus,* Nov. 1986 38B(5), p.364-374, 28 refs.

The back-scattering coefficient and depolarization ratio of antarctic stratospheric aerosols were observed by a lidar at Showa Station in 1983 to gather data on the nature of polar stratospheric aerosols. A balloon measurement was also made to determine the concentration of the particles. The balloon data showed a large concentration of particles with radius larger than 0.15 micron (15 particles/cu cm in the lower stratosphere) and a size distribution which was rich in smaller size particles. During early June, the back-scattering coefficient rapidly increased, but the depolarization ratio was at a low level. After mid-June, the depolarization ratio increased as the winter progressed, and this suggests that most of the stratospheric particles had non-spherical shapes (possibly ice crystal particles) in mid-winter. The lidar measurement showed that the stratospheric particles layer was transported downward at the rate of 0.8 mm/s during winter. The mass of water transported from the stratosphere to the troposphere is estimated to be about 50 million tons per winter season if we assume that the settling rate of the layer is due to gravitational sedimentation of ice crystal particles. If it is due to downward air motion carrying smaller crystals, this is reduced to 50 thousand tons. (Auth. mod.)

Margitan, J.J., **Causes and effects of a hole,** *Nature,* Jan. 22-28, 1987 325(6102), p.297-298, 5 refs.

The cause and significance of the antarctic ozone hole are discussed, as are the preliminary results from the U.S. National Ozone Expedition (NOZE) to McMurdo Station. The NOZE ozonesonde measurements showed significant vertical structure to the hole, with 80% depletion in some of the 1-km layers but only 20% in adjacent layers. The depletion was confined to the 12-20-km region, beginning first at the higher altitude and progressing downwards. The microwave instrument produced data on hydrogen cyanide, ClO and nitrous oxide, which show unusually low concentrations within the vortex. Measurements of aerosol particle densities show an upward transport. The tentative conclusion of the NOZE team is that there is strong evidence against the solar activity theory and some evidence against the dynamical theory, favoring a chemical mechanism as the most likely cause of ozone depletion in the hole.

Portniagin, IU.I., Solov'eva, T.V., **High-latitude structure of the temperature field in the mesopause-lower thermosphere region,** *Geomagnetism and aeronomy,* 1984 24(1), p.126-128, 6 refs., Translated from Geomagnetizm i aeronomiia.
DLC QC811.G383

The temperature fields found for the Southern Hemisphere show that a cold summer and a warm winter are typical of the high-latitude mesopause of both Northern and Southern Hemispheres. The height of the mesopause changes as a function of latitude and season. Thus, the minimum height of the mesopause (about 84 km) is observed in January at high latitudes of the Northern Hemisphere, the maximum height of about 90 km at low latitudes and the intermediate height of about 88 km at high latitudes in the Southern Hemisphere. A certain analogy with respect to January is noted in the height change of the mesopause as a function of latitude during July for the respective seasons: minimum height about 82 km is characteristic of high latitudes of the winter (i.e., southern) hemisphere; maximum height about 90-92 km in the lower latitudes and intermediate height about 84 km in the high latitudes of the summer hemisphere. The height-latitude temperature profiles plotted from the calculations for the periods of the solstices (January (a) and July (b)) and for the equinox periods (April (a) and October (b)) are shown.

Matveev, IU.L., Matveev, L.T., Soldatenko, S.A., **Global cloud field** [Global'noe pole oblachnosti], Leningrad, Gidrometeoizdat, 1986, 280p., In Russian with English summary. 355 refs.

Statistical analysis, parameterization and simulation of global cloud field has been performed on the basis of satellite data obtained for 1966-1980. The mean values, standards, coefficients of asymmetry and excess of cloud amount are analyzed at different time intervals and for different squares, with values averaged for the Earth as a whole and the latitudes, hemispheres, water and land areas, and every ocean and continent, including the antarctic region. Also, density of distribution, correlational and spectral functions of cloud amount are constructed and analyzed. Annual variations and geographic peculiarities of cloud distribution for the Earth as a whole have been investigated, and differences between the northern and southern hemispheres are discussed. It is shown that atmospheric dynamics plays an important role in the formation and evolution of cloud field; in its turn it is also in close connection with thermal inhomogeneity and advection (horizontal baroclinicity). Tezuka, M., Satoh, M., Sakuma, K., Mabuchi, K., **Meteorological observations at Syowa Station in 1981 by the Japanese Antarctic Research Expedition,** *Antarctic record,* Nov. 1986 30(3), p.189-218, In Japanese with English summary and captions. 8 refs.

This paper describes the results of meteorological observations carried out by JARE-22 at Showa Station from 1 Feb. 1981 to 31 Jan. 1982. The surface and upper air data were automatically processed by using the entire Automated Meteorological Observation System (AMOS) for the first time. Problems occurred in disk equipment of the system in Sep. 1981. Since then, the upper air observations had to be made in the same way as before JARE-20. The methods of the other observations and data statistics are almost the same as JARE-21. A new type instrument screen and CVCF (Constant Voltage & Frequency) were installed. This paper also describes the results of the experiment of special analysis of the upper air observations. (Auth.)

Hofmann, D.J., Harder, J.W., Rolf, S.R., Rosen, J.M., **Balloon-borne observations of the development and vertical structure of the antarctic ozone hole in 1986,** *Nature,* Mar. 5-11, 1987 326(6108), p.59-62, 11 refs.

The vertical distribution of ozone is described, which was measured at McMurdo Station using balloon borne sensors, on 33 occasions, during the period Aug. 25-Nov.6, 1986. These observations suggest a highly structured cavity confined to the 12-20 km altitude region. In the 17-19 km altitude range, the ozone volume mixing ratio declined from about 2 p.p.m. at the end of Aug. to about 0.5 p.p.m. by mid-Oct. The average decay in this region can be described as exponential with a half life of about 25 days. While total ozone, as obtained from profile integration, declined only about 35%, the integrated ozone between 14 and 18 km declined more than 70%. Vertical ozone profiles in the vortex revealed unusual structure with major features from 1 to 5 km thick which had suffered ozone depletions as great as 90%. (Auth.)

Iwasaka, Y., Ono, T., Nonura, A., **Changes in aerosol content and temperature in the antarctic spring stratosphere: lidar measurement at Syowa Station (69 deg S, 39 deg 35'E) in 1983, 1984 and 1985,** *Geophysical research letters,* Dec. 1986 13(13), p.1407-1410, 15 refs.

Measurements of stratospheric aerosols by means of a lidar system are described. The year-to-year changes in aerosol content were influenced by volcanic eruption of Mt. El Chichon (spring 1982, Mexico) and variations of stratospheric temperature. The aerosol load in winter of 1983 was about five times larger than the load of 1985. The particle content of spring 1985 was larger than that of spring 1983 even though the effect of the volcanic eruption was more severe in 1983. This may be a result of the decrease in average stratospheric temperature in spring. If heterogeneous reactions including the particles are indeed important for antarctic ozone depletion, the rate of ozone depletion from heterogeneous reactions in the antarctic spring must have increased from 1983 to 1985. Keys, J.G., Johnston, P.V., Matthews, W.A., **Antarctic "ozone hole" phenomenon: some aspects of related New Zealand research,** *New Zealand antarctic record,* 1986 7(2), p.1-4, 8 refs.

One of the major discussion topics in the atmospheric sciences during 1986 has been the identification of the "ozone hole" at south-

ern high latitudes—a region where stratospheric ozone has been shown to be steadily declining, perhaps for a decade. Superimposed on this steady fall is an additional rapid drop and subsequent partial recovery each spring. Various theories have been advanced to explain the phenomenon. Here the problem is outlined and some aspects where the present New Zealand research effort is targeted are discussed, in particular the measurements at Arrival Heights.

Saari, M.R., Yuen, D.A., Schubert, G., **Climatic warming and basal melting of large ice sheets: possible complications for East Antarctica,** *Geophysical research letters,* Jan. 1987 14(1), p.33-36, 23 refs.

Climatic warming is shown to be capable of inducing shear heating instability and basal melting in a model ice sheet that is creeping slowly downslope. Growth times of the instability are calculated from a nonlinear analysis of temperature and flow in the model ice sheet whose surface undergoes a prescribed increase of temperature. The source of instability lies in the decrease of maximum ice thickness for steady downslope creep with increasing surface temperature. A surface temperature increase of 5 to 10 K can cause instability on a 10,000 year time scale for realistic ice rheology. The instability occurs suddenly after a prolonged period of dormancy. The instability might be relevant to the East Antarctic ice sheet. Warming associated with the Holocene interglacial epoch that heralded the end of the last ice age may have set the East Antarctic ice sheet on a course toward widespread instability some 10,000 years later. The present CO2-induced climate warming is also a potential trigger for instability and basal melting of the East Antarctic ice sheet. (Auth.)

Iwasaka, Y., Kondoh, K., **Depletion of antarctic ozone: height of ozone loss region and its temporal changes,** *Geophysical research letters,* Jan. 1987 14(1), p.87-90, 5 refs.

Ozonosonde measurements at Showa Station from 1971 to 1984 show that ozone depletion is most striking in the region 10 km to 25 km in the last five years. The active ozone loss region in the spring shows good correspondence to the region where a noticeable drop in stratospheric temperature is observed from 1981 to 1985, but only in the spring. Monthly averaged lower-stratospheric temperature decreased smoothly from about 1975 to the present in the spring. The temperatures in October and November 1985 are comparable to the frost point temperature of water vapor with 10 ppmv mixing ratio at about 100 mb. The temperature drops observed in interannual trends could activate formation of ice particles, and cause noticeable ozone loss in the spring through heterogenous ozone reduction reactions. (Auth.)

Nagatani, R.M., Miller, A.J., **Influence of lower stratospheric forcing on the October antarctic ozone decrease,** *Geophysical research letters,* Mar. 1987 14(3), p.202-205, 11 refs.

The vertical component of the Eliassen-Palm (E-P) fluxes for the seven Septembers of 1979 to 1985 are shown to have a pattern correlation to 30 mb mean latitudinal ozone and temperature at 70 S for October, suggesting a dynamical influence on the long term trend of ozone and temperature values in the Southern Hemisphere for the period. For the August E-P fluxes and September parameters the relationship still appears to hold for temperature, but the ozone relationship is much weaker. (Auth.)

Barry, R.G., **Aspects of the meteorology of the seasonal sea ice zone,** NATO Advanced Study Institute on Air-Sea Interaction, Acquafredda di Maratea, Italy, Sep. 28-Oct. 10, 1981. Proceedings. Geophysics of sea ice. Edited by N. Untersteiner. NATO ASI series, Series B: Physics, Vol.146, New York, Plenum Press, 1986, p.993-1020, Refs. p.1013-1020.

A relationship is presented between the marginal ice zone and storm tracks. There is a parallelism observed in the Northern Hemisphere but the storm tracks are displaced 7 to 8 deg southward. In the Southern Hemisphere greater similarities are noted between the storm tracks and the location of the Antarctic Convergence Zone.

I-35415

Andreas, E.L., **Comment on "Atmospheric boundary layer modification in the marginal ice zone" by T.J. Bennett, Jr. and K. Hunkins,** *Journal of geophysical research,* Apr. 15, 1987 93(C4), p.3965-3969, Includes reply by Bennett and Hunkins. 19 refs. For the paper being critiqued see 41-1861 (I-34897) and for the Andreas et al paper which included the data used by Bennett and Hunkins, see 38-1819 (14I-29231).

Andreas briefly commends Bennett and Hunkins for an important contribution to MIZ research but points out numerous serious shortcomings in their methods, data interpretations, misrepresentations, misuse of mathematical equations, and a generally careless approach in the use of his data. In their reply, Bennett and Hunkins seem to agree that the criticism is justified.

Rowland, F.S., **Chlorofluorocarbons and the antarctic ozone hole,** *Environmental conservation,* Autumn 1986 13(3), p.193-194, 9 refs.

Measurements of chlorine compounds over Antarctica are to date very scarce, and attempted explanations for this loss of ozone are made in the absence of detailed experimental knowledge of the chemical composition of the antarctic stratosphere in Sep. and Oct. The present hypothesis is that heterogeneous reactions can occur during the cold antarctic night on the known polar stratospheric clouds (PSCs). One of these is the hydrolysis of N2O5 to form nitric acid, and a second is the hydrolysis of chlorine nitrate. A third possibility is the reaction of HCl with chlorine nitrate, although this would require very high particle-collision efficiencies. Measurements over Antarctica have already shown diminished NO2 concentrations in the spring, consistent with conversion of NO2 to N2O5 and then to HNO3. Because of the long lifetimes of chlorofluorocarbons, the antarctic ozone hole (and other possible temperature-latitude effects) may be expected to last for the entire 21st century.

Beardmore, D.J., Pearman, G.I., **Atmospheric carbon dioxide measurements in the Australian region: data from surface observatories,** *Tellus,* Feb.-Apr. 1987 39B(1-2), p.42-66, 23 refs.

Observations of the atmospheric carbon dioxide concentration made at surface locations in the Australian and Antarctic regions are presented for the period 1976-1984. These observations complement those already reported which were based on samples collected from aircraft throughout the troposphere and lower stratosphere in the same region. Data are presented for 4 sites, Cape Grim (northwestern Tasmania), Mawson, Macquarie Island, and Wilbinga (Perth area), and for air samples collected on board ships traversing the southern ocean. Methods are considered for the selection of data to represent the baseline or background concentration and a description is given of the natural variability of CO2 concentration, including within-hour and diurnal variability, seasonal cycles, interannual and secular trends. The average rate of concentration increase over the period represented by the data was 1.5 ppmv/yr. A comparison is made between the selected data from these programs and similar data sets collected at Amsterdam Island and in New Zealand by other international projects. (Auth.)

Siegenthaler, U., Oeschger, H., **Biospheric CO2 emissions during the past 200 years reconstructed by deconvolution of ice core data,** *Tellus,* Feb.-Apr. 1987 39B(1-2), p.140-154, 39 refs.

Measurements on air trapped in old polar ice from Siple Station have revealed that the pre-industrial atmosphere contained 280 ppm of CO2 and that *delta*C-13 of atmospheric CO2 decreased by about 1.1 per mill until 1980. These measurements show that considerable amounts of non-fossil CO2 must have already been emitted into the atmosphere in the 19th century. Deconvolution of the CO2 record yields a cumulative non-fossil production of about 90 to 150 Gt C until 1980, of which more than 50% were released prior to 1900. According to model results, the net non-fossil production rate was roughly constant in the 19th and the first part of the 20th century. In the past 30 years, smaller values are obtained which are at the lower limit or below current ecological estimates for deforestation and land use. Calculated C-13 and C-14 time histories agree well with the observed changes. While the change of the atmospheric CO2 concentrations reflects more the cumulative carbon release, the isotope concentrations are more sensitive to short-term changes of the emission rate. (Auth. mod.)

Elliott, W.P., Angell, J.K., **On the relation between atmospheric CO2 and equatorial sea-surface temperature,** *Tellus,* Feb.-Apr. 1987 39B(1-2), p.171-183, 19 refs.

Associations between the sea-surface temperature (SST) in the eastern equatorial Pacific and changes in atmospheric CO2 concentration have been examined. The CO2 records at Mauna Loa and the South Pole of the Scripps Institution of Oceanography, and the shorter records of the Geophysical Monitoring for Climatic Change program at Barrow, Samoa, the South Pole and Mauna Loa, were used after the annual cycles and the growth due to fossil fuel emissions had been removed. It was found that warmer than average SST precedes above-average increases in CO2 by about one season at Mauna Loa and two seasons at the South Pole. The shorter records at Samoa and Barrow support longer lags: 2-3 seasons at Samoa and 3 to 5 seasons at Barrow. The correlations and their lags change with time, however, there being periods of relatively high correlation associated with El Niño events and periods of lower correlation when El Niño is not present. Furthermore, there is a seasonal preference for these high correlations. At Mauna Loa, the change of CO2 from (NH) fall to spring is better correlated with antecedent SST than the changes from spring to fall. At the South Pole, a similar pattern is found with a one-season shift. (Auth.)

Kottmeier, C., Stuckenberg, H.-U., **Quasi-geostrophic flow solution for the circulation over Antarctica,** *Beiträge zur Physik der Atmosphäre,* Nov. 1986 59(4), p.491-504, In English with French and German summaries. 27 refs.

The main features of the mean circulation over Antarctica in summer and winter are derived from a description of the temperature field by analytical functions. The antarctic temperature field results from an empirical determination of the height of one isentropic surface and of the vertical temperature gradient above the planetary boundary layer. The temperature distribution shows that the antarctic continent as a first order effect causes a disturbance of the temperature field, which is closely linked to the topography. The approximation of the data-based isentropic surface is achieved by the superposition of several bell-shaped functions. The stream function results from the vertical integration of these functions, and the velocity components from the subsequent horizontal differentiation of the stream function. The computed wind field for the mean sea level is compared with a geostrophic wind field from reduced pressure measurements. The comparison shows qualitative agreement between 65 S and 90 S. Deviations from polar axisymmetry are also reproduced. (Auth.)

Heinemann, G., **Lee-vortices in the Antarctic,** *Beiträge zur Physik der Atmosphäre,* Nov. 1986 59(4), p.599-602, 4 refs.

Obstacles in the atmospheric flow can lead to the formation of waves and vortices of very different scales. Besides synoptic scale cyclones one can observe micro- and mesoscale (vertical) gravity waves as well as mesoscale (horizontal) vortices. Mesoscale eddies can be produced at singly situated mountains or at other particular orographic places. Only with the aid of satellite pictures did it become possible to study the structure of these phenomena. Satellite photos of Peter I Island are used to demonstrate eddy formation at isolated mountain peaks. (Auth. mod.)

Trenberth, K.E., **Signature of a blocking episode on the general circulation in the Southern Hemisphere,** *Journal of the atmospheric sciences,* Oct. 1, 1986 43(19), p.2061-2069, 14 refs.

Two major blocking events took place over the South Pacific Ocean east of New Zealand, 23 July-4 Aug. and 19-27 Aug. 1979. The configuration of the overall flow, including the split in the westerlies, the location of the blocking highs, and the wavenumber breakdown were very similar. The tendency for blocking highs to reform in the same location in close sequence is referred to as a blocking episode. The blocking events are analyzed in detail and the imprint they left on the general circulation statistics for the winter as a whole are presented. Since the blocking episode mostly prevented eddies from moving through the region, the variance of meridional velocity is small. Nevertheless, owing to the sequence of blocks the variance of geopotential height is a maximum. This signature on the general circulation is in marked contrast to that in storm track regions where the variance of geopotential height and meridional wind are both a maximum. A global-scale redistribution of mass was associated with the blocking episode. Antarctic data are included in the analyses. (Auth. mod.)

I-35498

Trenberth, K.E., **Assessment of the impact of transient eddies on the zonal flow during a blocking episode using localized Eliassen-Palm flux densities,** *Journal of the atmospheric sciences,* Oct. 1, 1986 43(19), p.2070-2087, 24 refs.

In this paper the entire Southern Hemisphere blocking episode described in I-35497 is examined in greater detail with emphasis on the role of the transient eddies and their influence on the zonal mean flow. In particular, a question of considerable interest is the role of the eddies in maintaining or destroying the block. The theory for the local E-P flux is developed first for an *f*-plane to illustrate the concepts and then for full spherical geometry. The results are discussed in terms of the previous theories of Hoskins et al. and Plumb. The relevant fields for the case study of the blocking episode are presented as derived from FGGE IIIb data, and the initial results are given from the perspective of barotropic instability alone. A more comprehensive theory for the local E-P flux is then applied to the case and the flux vectors and computations of its divergence are presented, which represents the main eddy forcing on the zonal mean flow. Results are discussed and conclusions drawn.

Stearns, C.R., Weidner, G.A., **Antarctic automatic weather stations, austral summer 1984-1985,** *Antarctic journal of the United States,* 1985 20(5), p.189-191, 3 refs.

The automatic weather stations (AWS) measure air temperature, air pressure, wind speed and wind direction under the control of a microcomputer. The data are updated every 10 minutes and transmitted at 200 second intervals to the Argos system on the NOAA series of polar orbiting satellites. The objectives are the following: barrier wind along the Transantarctic Mountains and the Antarctic Peninsula; katabatic flow down the Adelie Coast, Byrd Glacier and Reeves Glacier; meso-scale circulation on the Ross Ice Shelf; climatology of Dome C, Byrd Station and Siple Station; sensible and latent heat fluxes on the Ross Ice Shelf; oceanographic support; and meteorological support for aircraft operations at McMurdo. During AS 84-85 five of the seven AWS units which ceased being received by the Argos system were repaired and reinstalled. Two AWS units were deployed to 79.56 S, 169.45 E and 80.00 S, 179.00 W on the Ross Ice Shelf. Improvements made to the AWS units included a waterproof box, a short boom with the aerovane at the midpoint and a ground plane antenna. Eighteen of the 22 AWS units deployed are being received with correct data as of 1 May 85.

Cronn, D.R., Ferrara, T.W., Bamesberger, W.L., **Air chemistry monitoring at Palmer Station,** *Antarctic journal of the United States,* 1985 20(5), p.191-192, 7 refs.

The 1984-1985 season was the third year of operation for the Washington State University Palmer Station air chemistry facility. The two-fold objective for the 1984 season was to continue the atmospheric trace chemistry monitoring and to measure the chemical composition of precipitation. The concentrations as a function of time are shown for nitrous oxide F-12, F-11, carbon tetrachloride, and methyl chloroform, respectively. Missing data result both from periods of equipment failure and unreduced data. The data cover the

period from Apr. 4, 1982 through Apr. 27, 1985. A table shows the preliminary results of the time trend regression analysis for five of the atmospheric components based on 3 years of preliminary average weekly concentrations. The trends for F-11, F-12, methyl chloroform, and carbon tetrachloride continue to show increasing concentrations of 5.2%, 5.9%, 5.5%, and 1.3% per year, respectively. Rain samples were analyzed for pH and acidity, anions and cations. Preliminary results of the pH measurements gave volume-weighted means for the Palmer Station samples only of 4.68, 4.98, and 5.13 for Jan., Feb., and Mar. 1985, respectively. These values are lower than the pH of 5.65 expected from equilibrium with atmospheric carbon dioxide and therefore might be considered "acid" rain.

Losleben, M., **Weather and solar radiation measurements at Mount Takahe and Mount Murphy, West Antarctica,** *Antarctic journal of the United States,* 1985 20(5), p.193-196, 3 refs.

The weather was recorded one to six times each day, as conditions permitted, from Dec. 21, 1984 through Jan. 18, 1985 primarily around the base of Mount Takahe but also for 5 days near Mount Murphy. A table summarizes these recordings. Solar radiation was recorded from Jan. 10 to 17, 1985 at the Gill Bluff camp near Mount Takahe but only the entire days of Jan. 11 to 16 are tabulated. This is total incoming (direct plus diffuse), short-wave (285- to 2,800-nanometer) radiation reaching the ground. The total incoming radiation in 20-minute totals by day, with the total for that day, is shown. Some comparisons were made with other sites and with calculations. The Mount Takahe values ranged from a high of 63.2 to 60.7% to a low of 51.6 to 50.0% of their corresponding calculated values. For these 6 days in Jan., this antarctic site compared closely, though a bit lower, to a similar (by latitude) arctic site. Some possible mitigating factors could have been the proximity of Mount Takahe and greater cloud coverage.

Bromwich, D.H., **Katabatic wind interaction with Inexpressible Island, Terra Nova Bay,** *Antarctic journal of the United States,* 1985 20(5), p.196-198, 9 refs.

The interaction of gale force katabatic winds with the steep topography of Inexpressible I. shows a strong seasonal dependence. In summer the airflow overrides cliffs more than 300 m high, and creates a stagnation zone on the windward side of the obstacle. In winter it is inferred that the air is generally deflected around the main part of the island. Summer data usually demonstrate that measurements from the automatic weather station (AWS) sited on the southern tip of the island accurately reflect the characteristics of the upwind katabatic airflow. It is possible that the winter AWS data are less representative.

I-35533

Saxena, V.K., Ruggiero, F.H., **Real-time measurements of droplet size distribution in antarctic coastal clouds,** *Antarctic journal of the United States,* 1985 20(5), p.198-200, 15 refs.

In the Ross Ice Shelf region, measurements of cloud droplet size distribution were carried out using a forward scattering spectrometer probe (FSSP) in coastal clouds during Nov. 1980. The two-dimensional cloud boundaries for Nov. 3-5, 1980 are illustrated. A table summarizes the observed and calculated parameters for each cloud. These parameters are representative of what one would expect to find in maritime clouds. A strong correlation was observed between the droplet diameter and height from the cloud base with a correlation coefficient of 0.93. The spectral broadening with height is also readily apparent when comparing individual droplet size distributions. It can be seen that all the clouds exhibit bimodal size distributions of varying degrees with an initial peak in concentration occurring at a diameter less than 4 micrometers. The diameter at which the second peak occurs varies between 12 and 16 micrometers, and it is this peak that seems to vary with height. Since aerosols as large as 100 micrometers are known to exist in the atmosphere, it is possible a second peak in droplet size distribution could result from these CCN. The sea is believed to be a source for some of these ultra-giant aerosols.

Saxena, V.K., Ruggiero, F.H., Parungo, F.P., **Airborne measurements of the antarctic cloud water acidity,** *Antarctic journal of the United States,* 1985 20(5), p.201-203, 8 refs.

Samples of cloud water were collected from antarctic coastal stratus during the 1982-1983 austral summer to assess the natural component of cloud-water acidity. The pH value ranged between 4.9 and 6.2, and the average value was below that expected for the Antarctic, so far from all anthropogenic sources of acidic and acidifying substances. Acidity was found to increase with height inside the cloud probably due to the entrainment of sulfate rich stratospheric air at the cloud top. Average levels of sulfate were found to be of the same magnitude as those in more anthropogenic regions while nitrate levels were much lower in antarctic stratus clouds than elsewhere. Results of the analysis of the cloud water samples are presented.

I-35535

Shaw, G.E., **Nature and size of microscopic airborne particles at McMurdo Station,** *Antarctic journal of the United States,* 1985 20(5), p.204.

Studies were carried out from the cosmic ray station near McMurdo Station on Ross Island to investigate the origin, number concentration, and size of the remnant particles suspended in the very clean antarctic air. Particles larger than about 2 micrometers were strongly depleted in the "background" antarctic air. In terms of aerosol mass, evidence was found for the occasional existence of a large to giant mode during times when the winds were high or from the direction of the sea. Geometric mean diameter of the particles was 0.015 micrometer. Aerosols down to 0.1 micrometer diameter were impacted on barium sulfate screens and found to leave etching patterns similar to those caused by droplets of sulfuric acid. Additional evidence suggesting a sulfuric acid composition was obtained from the relatively low boiling point of the submicron particles; they decomposed at about 150 C. Sulfate mass concentration in the submicron sizes was measured with ion chromatography and yielded a mean mass loading of 0.1 microgram/cu m.

Hogan, A.W., Samson, J.A., **Aerosol transport processes in the Antarctic,** *Antarctic journal of the United States,* 1985 20(5), p.205-206, 4 refs.

The 1984-1985 summer activities at Amundsen-Scott Station are reported. They include aerosol observations and particle collections; wind surveys, with updating of wind instruments on the meteorological tower and installation of an experimental precipitation collector; vertical measurements of temperature on the tower; and working with a new computer system through a series of programs to facilitate on-site analysis and reduction of meteorological, climatological, and upper-air data. Due to the occurrence of very large sastrugi in the vicinity of the station, a polished steel funnel was used as a radiation shield for temperature measurements on the surface of the sastrugi which resulted in readings showing large temperature differences between the sunlit and shadowed sides. For aerosol experiments in Nov. a new impactor concentrator was used to collect particles with diameters greater than 0.1 micrometer but less than 0.5 micrometer which seem to dominate the particle mass, according to light-scattering measurements. Analysis of these particles showed an abundance of sulfur. Silicon-containing particles were frequent in the size classes above 0.5 micrometer. A similar experiment was conducted

during Jan., and one of the most interesting aspects of this period was the strong, and unusually high, temperature inversion located about 1,000 m above the surface.

Khalil, M.A.K., Rasmussen, R.A., **Trend of bromochlorodifluoromethane and the concentrations of other bromine-containing gases at the South Pole,** *Antarctic journal of the United States,* 1985 20(5), p.206-207, 11 refs.

Concentrations of 8 manmade and natural bromine-containing trace gases at the South Pole during the last quarter of 1984, and the increasing concentrations of bromochlorodifluoromethane (CBrClF2), are discussed. . The seasonally averaged concentrations over nearly 6 years (from Jan. 1979 through Dec. 1984) are shown. The ratio of the Northern Hemisphere to Southern Hemisphere concentrations is about 1.3 suggesting that the atmospheric lifetime of CBrClF2 is relatively long, probably much longer than a decade. The concentrations of 7 other bromine-containing gases at the South Pole, during the period from Oct. through Dec. of 1984, are reported in a table. The total gaseous bromine concentration is about 22 parts per trillion by volume. The ratios of the concentrations observed at the South Pole and at Point Barrow in the Arctic at about the same times are also tabulated.

I-35538
Murcray, F.J., Murcray, F.H., Murcray, D.G., **Measurements of column amounts of atmospheric trace gases during the antarctic winter,** *Antarctic journal of the United States,* 1985 20(5), p.208.

The goal of this program is to operate an infrared spectrometer system to measure the thermal emission of the atmosphere for an extended period, including part of the austral winter. A prototype instrument was operated for a few weeks at Amundsen-Scott Station during the 1982-1983 austral summer. With the experience gained from that experiment, a more elaborate system was constructed, the atmospheric emission radiometer (AER). The AER will provide an initial site survey for infrared astronomy by measuring atmospheric emissions over a long period. It will also give information on the radiative balance of the antarctic region from the observations of the snow surface.

I-35539
Ohtake, T., **Chemical tests of antarctic hygroscopic aerosols,** *Antarctic journal of the United States,* 1985 20(5), p.208-210, 7 refs.

To clarify the mechanism of polar atmospheric ice crystals, aerosols for ice nucleation were examined at the South Pole in austral summers 1982-1983 and 1983-1984. Formation of ice crystals on the aerosols was confirmed when relative humidity rises to 82% at -25 C or 79% at -37 C. On the basis of these observations, it is postulated that the hygroscopic aerosols in the polar atmosphere deliquesce in ambient humid air and are followed by freezing of the submicron-sized water droplets to ice crystals at low temperatures. These short-lived water droplets and subsequent ice crystals are small enough to be nearly invisible, unless the ice crystals grow to a larger size. The minimum size of collected particles was estimated to be 0.01 micrometer in diameter. An example of the particles collected is shown. The preliminary results of electron microscopy show the following: most of the aerosols sampled by the cascade impactor were identified as sulfate; the low-pressure impactor was able to collect sulfuric acid particles at a rate of about 4 particles per cu cm at mean diameter of 0.1 micrometer; minimum size detected was 0.1 micrometer; the factions of sulfate particles were about 99% total aerosols. Other aerosols (1%) were identified as combustion by-products and soil particles rather than sulfate; those few soil particles do not seem to be mixed with any sulfate.

Cassidy, W.A., Witkowski, R.E., Penney, G.W., **Atmospheric particle collections at Amundsen-Scott South Pole Station during 1984,** *Antarctic journal of the United States,* 1985 20(5), p.210-212.

During 1983, a program was begun at the geographic South Pole to collect atmospheric dust particles in the size range 0.01 to 1 micrometer, and this effort continued during 1984. It is found that submicroscopic particles are very abundant in the atmosphere at Amundsen-Scott Station. The most common constituent of the collections is droplets of sulfuric acid; it is also common to find submicroscopic alumino-silicate spheres that probably are slaggy by-products of fuel burning. In addition to particles such as these which can be identified as terrestrial contaminants, a number of particles were found whose terrestrial origin could not be confirmed. Even more numerous than sulfuric acid droplets are rod-shaped grains 0.05 to 0.10 micrometer in length that give calcium and sulfur signatures under STEM/EDS (scanning transmission electron microscopy/energy dispersive systems) analysis. Rather rare in number, but perhaps more significant in mass, is another group of grains that apparently consists of single metallic elements (or their oxides, hydroxides, carbides, or carbonates).

Wendler, G., Kodama, Y., Gosink, J., **Automatic weather stations in eastern Antarctica,** *Antarctic journal of the United States,* 1985 20(5), p.212-213, 4 refs.

In a joint French-U.S. experiment, five automatic weather stations (AWS) have been installed on Adélie Coast. They report data by satellite and since 1980 have supplied a steady flow of meteorological information. They are located roughly on 1 line from D10 (240 m altitude), a station 10 km south of Dumont d'Urville Station, to Dome C (3,280 m altitude), the highest station some 1,080 km inland from the coast. The other three stations are located at intermediate points. The mean monthly temperatures of the AWS are given in a figure showing the combined data from 4 stations. The mean diurnal variation of the wind vector at D80, in summer 1983, is also shown. The strongest winds are observed around noon, while the most downslope wind occurs in the early morning hours, when the inversion strength has reached its maximum.

I-35542
Mroz, E.J., **Detection of atmospheric tracers in Antarctica,** *Antarctic journal of the United States,* 1985 20(5), p.214-215.

Two tracer gases, 12CD4 and 13CD4, were used to study meridional flow in Antarctica. Releases were conducted in Jan., June and Oct. of 1984. The Jan. and June releases consisted of 1 kg of 13CD4 released at about 60 S, 70 E and at 18000 ft MSL. The Oct. release consisted of 1 kg of 13CD4 released at 5000 ft MSL and 20 kg of 12CD4 released at 18000 ft MSL at approximately the same location as the two earlier releases. Sampling for the tracers was conducted at eight stations and, following the Jan. and Oct. releases, by aircraft. Following the Jan. release, tracer was detected over the Ross Ice Shelf 26 hours after the release. Tracer was also detected at Amundsen-Scott and Halley Bay stations within about 10 days after the release.

Dilts, S.B., Cronn, D.R., **Determination of sulfur gases in the antarctic atmosphere,** *Antarctic journal of the United States,* 1985 20(5), p.215-216, 5 refs.

A research program was conducted during austral summer 1985 to survey the ground-level concentration of atmospheric sulfur gases in Antarctica. The measurements were made by metal foil collection/flash vaporization/flame photometric detection (MFC/FV/FPD). Sample air is passed over a palladium foil strip which adsorbs the sulfur gases. The loaded foil is flash heated by an

electric current, and the desorbed gases are carried to a flame photometric detector which is sensitive to sulfur molecules. The foils are mounted in teflon blocks which can be taken into the field, sampled with portable pumps, and returned to the laboratory for analysis. Preliminary results from the MFC/FV/FPD analyses show total sulfur gas concentrations in the low parts-per-trillion range which is much less than expected, based on other investigators' results for remote areas. Testing of the repaired MFC/FV/FPD system and statistical analysis of the results are continuing to check the validity of the measurements.

Hofmann, D.J., Rosen, J.M., **High-altitude aerosol variations associated with stratospheric warmings,** *Antarctic journal of the United States,* 1985 20(5), p.217-218, 2 refs.

In Oct. 1983 a balloon sounding was conducted to determine to what extent volcanic sulfuric acid aerosol, injected by the eruption of El Chichon in Mexico in Apr. 1982, had affected the antarctic stratosphere. A sizeable layer of aerosol was detected in the 10 to 17 km altitude range. In 1984, the measurements were repeated, this time with two optical particle counters for better resolution and two balloon soundings, one at McMurdo Station on Nov. 1, 1984 and one at Amundsen-Scott Station on Nov. 10, 1984. As in 1983, a stratospheric warming was again underway during the soundings. The wind speeds in the 20 to 30 km altitude region were quite high, peaking at about 70 m/s at McMurdo on Oct. 29. These high winds suggested that the aerosol has been in several temperature regimes during a day or two prior to their observation and resulted in very complicated distributions. The results of the two balloon soundings for both the large and small aerosol are shown. The remnants of the El Chichon eruption can be seen in the larger, optically active aerosol (radius greater than 0.15 micrometer) between about 9 and 18 km altitude. This layer, which is a global feature, is nearly identical at the two stations. The peak concentration is about 3.5 particles per cu cm. One year earlier this concentration was 7.0 particles per cu cm. Thus the layer has decayed by a factor of two in 1 year.

Garcia, K.S., **Weather observing and transmitting problems in the Antarctic,** *Antarctic journal of the United States,* 1985 20(5), p.269-270.

Antarctic weather problems which have plagued observers and frustrated forecasters since before the IGY continue unchecked and unresolved: paucity of antarctic data, even during the summer season; rapidly changing surface conditions due to the summer opening of the Ross Sea; unreliable transmission of weather data, with no provisions for resending missed data; interference with communication due to atmospheric disturbances. More advanced communication systems are expected to improve the reliability of meteorological data received from the continent. Examples of local differences in weather factors are also shown.

Lal, D., Nishiizumi, K., Arnold, J.R., ***In situ* H-3, C-14, and Be-10 for determining the net accumulation and ablation rates for ice sheets,** *Journal of geophysical research,* May 10, 1987 92(B6), p.4947-4952, 32 refs.

The usefulness is explored of the *in situ* cosmogenic H-3, C-14, and Be-10 produced by spallation of oxygen nuclei in ice, as tracers to determine net accumulation/ablation rates of ice sheets. The application of the *in situ* H-3 and Be-10 is severely constrained because, at deposition, ice contains appreciable amounts of these isotopes from the atmosphere. The case is much more favorable for C-14, which is not carried with wet precipitations; atmospheric C-14 gets mechanically trapped in the ice during deposition. It is pointed out that cosmogenic C-14 would probably exist as CO-14 in ice. Conditions under which these isotopes can be used to study net accumulation and ablation rates are discussed along with available data on C-14 and Be-10 on polar ice from accumulation and ablation zones. It is concluded that H-3 and C-14 should find wide applications in studying ice dynamics and Be-10 in very special circumstances. Tables are included showing concentrations of C-14 and Be-10 at Byrd Station, Allan Hills, Dome C, Vostok, and in the Yamato Mountains. (Auth.)

Wu, M.-F., Geller, M.A., Olson, J.G., Larson, E.M., **Study of global ozone transport and the role of planetary waves using satellite data,** *Journal of geophysical research,* Mar. 20, 1987 92(D3), p.3081-3097, 51 refs.

Global ozone fluxes and flux divergences within the region between 30 and 0.4 mbar are computed for the period from Dec. 1, 1978 to Nov. 30, 1979, using Nimbus 7 solar backscattered ultraviolet ozone profiles and meteorological data derived from NOAA satellites. The annual cycle of ozone transports in the Northern and Southern Hemispheres is presented and discussed. It is found that planetary scale waves are responsible for initiating the high-latitude ozone buildup in winter. The time of occurrence and the position of the annual maximum ozone are found to be closely related to the planetary wave activity in both hemispheres. (Auth.)

Gillette, D.A., Komhyr, W.D., **NOAA/GMCC continuous CO2 record at the South Pole, 1975-1982,** *Journal of geophysical research,* Apr. 20, 1987 92(D4), p.4231-4240, 20 refs.

Hourly carbon dioxide concentrations at the south pole were obtained by nondispersive infrared analyzers for the years 1975-1978 and 1980-1982. A spectral analysis of the ambient CO2 variability showed very little power for periods shorter than 5 days. The data showed good agreement with other data sets for the range of the annual fluctuation from 1977 to 1982 and disagreements for 1976. The estimated annual CO2 increase (about 0.6 to 2 ppm/yr) and ranges of seasonal fluctuation were insensitive to the data selection methods used. After 1979, seasonal fluctuations apparently decreased. (Auth.)

McCormick, M.P., Trepte, C.R., **Polar stratospheric optical depth observed between 1978 and 1985,** *Journal of geophysical research,* Apr. 20, 1987 92(D4), p.4297-4306, 51 refs.

Observations of the stratospheric optical depth at 1.0 micron obtained for high latitudes are presented for a 7-year period. Weekly averaged data show that the overall yearly values in both polar regions are controlled by volcanic perturbations, with most volcanic effects being experienced in arctic latitudes. The largest values over this period were observed after the eruption of El Chichon in 1982. Conservatively, peak values found in the antarctic region were approximately 0.02 and in the arctic region about 0.55. Probable values for these regions were estimated to be 0.26 and 0.11, respectively. Comparison of the optical depth record with a weekly averaged 50-mb temperature record indicates that polar stratospheric clouds are present in the southern high latitudes each year near this level from early June to early Sep. A depression observed in the optical depth record each austral spring season is believed to be the result of the downward displacement of particles caused by subsidence and sedimentation during the course of winter. Following the breakup of the vortex, optical depth values increase as aerosol is transported poleward. These features are noted to be present in the Arctic region as well, but on a smaller scale because of the satellite sampling methodology and the averaging scheme employed. (Auth.)

Moczydlowski, E., **Microclimate of the nest sites of pygoscelid penguins (Admiralty Bay, South Shetland Islands),** *Polish polar research,* 1986 7(4), p.377-394, 23 refs.

The microclimate of the nest sites of *Pygoscelis adeliae, P. antarctica* and *P. papua* was studied from Dec. 1979 to Jan. 1981. The temperature of the ground, air temperature at 0.05 m, 0.35 m and 2 m and wind velocity at 0.35 m and 2 m above the ground were recorded. The wind velocity in the places chosen by penguins for nesting was lower than that at the meteorological station by 22% to 60%. It was proved that in winter the mean monthly ground temperature at the nesting places was lower than that at the meteorological station by 6 to 8 C due to the much thinner snow cover. Pygoscelid penguins chose, for nesting, places of specific microclimate and modified the wind velocity, temperature of the ground and, to a lesser extent, the air temperature. (Auth.)

Dudeney, J.R., **The antarctic atmosphere,** Antarctic science, D.W.H. Walton, ed., Cambridge, Cambridge University Press, 1987, p.190-247, 12 refs. (p.273).
DLC G860.A555 1987

Through the years of meteorological and upper atmosphere and space research it has become evident that understanding these regions as they work in Antarctica is requisite to understanding the upper reaches on a global basis. Details of gathering the data for this understanding are given in this essay: paleoclimates; history of weather observations in Antarctica; development and impact of satellites and automatic weather stations; the clear, cold antarctic winters and the accompanying surface inversion; katabatic winds; stratospheric circulation and the ozone layer; geospace research, solar wind, magnetic field, and the magnetosphere; the research milestones of the IGY, IQSY, all-sky-camera, riometer, and ionosondes; and the prime roles played by Halley and Siple Stations in this research.

Iwasaka, Y., **Descending motion of antarctic stratospheric aerosol layer in winter: possible effect on stratospheric water vapor budget,** *Tokyo. National Institute of Polar Research. Memoirs,* Dec. 1986 Special issue No.45, Proceedings of the Eighth Symposium on Polar Meteorology and Glaciology, p.13-18, 16 refs.

Lidar measurements at Showa Station revealed that the centroid of aerosol layer descended at the rate of 0.8 mm/s during winter. If this motion is a substantial movement of aerosol particles, the mass of water transported into the troposphere is about 50,000,000 t/winter, and the antarctic winter stratosphere is an important sink of stratospheric water vapor. If it is a downward air motion carrying small ice crystals, the value is reduced to 50,000 t/winter. (Auth.)

Kakegawa, H., Yasunari, T., Kawamura, T., **Seasonal and intra-seasonal fluctuations of polar anticyclone and circumpolar vortex over Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Dec. 1986 Special issue No.45, Proceedings of the Eighth Symposium on Polar Meteorology and Glaciology, p.19-29, 4 refs.

Fluctuations of the polar anticyclone at sea level and the circumpolar vortex at 500 mb are examined by using daily sea level and 500-mb weather maps of 1983. In addition to the seasonal cycle, a remarkable intra-seasonal fluctuation with a period of about 30 days is noticed in the intensity of polar anticyclone and in the circumpolar vortex. It is also noticed that in the seasonal time scale the intensities of polar anticyclone and circumpolar vortex show a positive correlation while in the intra-seasonal time scale these two are negatively correlated. Parish, T.R., Bromwich, D.H., **Surface windfield over the antarctic ice sheet,** *Nature,* July 2-8, 1987 328(6125), p.51-54, 18 refs.

The intense radiative cooling of air over the ice slopes of Antarctica generates a surface wind regime that is strongly controlled by topography, and plays a key role in determining the behavior of the atmosphere and ocean in high southern latitudes. Resultant surface winds are intimately linked to the orientation of the ice terrain and display the highest degree of persistence found on Earth. The close coupling between wind and topography allows estimation of the former if the latter is known with some precision. Here we report on time-averaged, near-surface airflow over the antarctic continent during winter diagnosed from a recent, accurate synthesis of terrain slopes and from estimates of the lower atmospheric temperature structure. The simulated drainage pattern exhibits strong spatial variability with the airflow concentrated into several zones near the coastal margin. These confluence regions are responsible for strong persistent katabatic winds over downstream coastal stretches and are indicative of zones of greatest katabatic potential. (Auth.)

Randel, W.J., **Study of planetary waves in the southern winter troposphere and stratosphere. Part 1: Wave structure and vertical propagation,** *Journal of the atmospheric sciences,* Mar. 15, 1987 44(6), p.917-935, 18 refs.

Planetary wave propagation in the southern winter troposphere and stratosphere is studied in an attempt to trace the origins of upward propagating disturbance. Daily geopotential grids from 1000 to 1 mb are analyzed for two 120-day winter seasons. A cross-correlation analysis technique is developed which allows coherent wave structure to be traced in time. Significant correlations are observed between the troposphere and stratosphere at finite time lags, indicative of vertically propagating waves. The cross-correlation analysis also delineates the meridional and vertical structures of the transient (in time) planetary waves. Zonal wavenumber 1 fluctuations exhibit a vertical out-of-phase relationship between the midaltitude troposphere and stratosphere. Three out-of-phase maxima in latitude are observed in the troposphere, separated by 25-30 deg latitude, whereas a single broad latitudinal maximum is found in the stratosphere. Two out-of-phase maxima in latitude are observed in the troposphere, separated by 30-35 deg latitude, and the stratospheric variance is found to be coherent and in phase with that in the high latitude troposphere. (Auth. mod.)

Randel, W.J., Stevens, D.E., Stanford, J.L., **Study of planetary waves in the southern winter troposphere and stratosphere. Part 2: Life cycles,** *Journal of the atmospheric sciences,* Mar. 15, 1987 44(6), p.936-949, 17 refs.

Large-amplitude planetary waves in the southern winter stratosphere are observed to occur episodically, the result of episodic tropospheric forcing. This work is an observational study of the dynamics of the planetary waves, focusing on the evolution through a typical life cycle. Time lag correlations of wave amplitude with the Eliassen-Palm flux vector reveal the characteristic heat and momentum flux patterns associated with wave evolution. Energetic studies clearly show that the stratospheric waves can be understood in terms of a life cycle of vertical propagation from the troposphere, followed by decay from barotropic interactions with the zonal mean flow. Although usually of secondary importance, baroclinic decay of stratospheric wave energy is also observed, resulting from equatorward heat flux in the lower stratosphere. Good agreement in the energy balances discounts *in situ* instability in the stratosphere as a source of wave activity. An average or composite over several clearly propagating cases reveals the wave structure and evolution, and suggests a source of planetary wave activity in the upper troposphere. (Auth.)

Prather, M., **Chemistry of the global troposphere: fluorocarbons as tracers of air motion,** *Journal of geophysical research,* June 20, 1987 92(D6), p.6579-6613, Refs. p.6611-6613.

Winds and convective mixing from a general circulation model of the atmosphere have been applied in a chemical tracer model to simulate the global distribution and temporal variability of chlorofluorocarbons (CFCs). The model reproduces global distributions and trends for CFC-11 and CFC-12 observed by the ALE experiment; however, subgrid diffusion must be introduced into the model in order to reproduce the observed interhemispheric gradient. Interhemispheric exchange occurs mainly in the upper tropical troposphere, producing a profile which increases with altitude in the Southern Hemisphere, in agreement with observations. The distribution of CFCs is such that it is necessary to apply important corrections to observations at surface stations in order to derive global distributions. (Auth. mod.)

North, D.C., **Green flash in Antarctica, April 1985,** *Weather,* May 1987 42(5), p.144-145.

A phenomenon commonly referred to as the 'Green Flash', caused by a combination of atmospheric refraction and selective absorption is discussed and shown in photographs. This example occurred in Antarctica in Apr. during the austral winter of 1985 and was photographed from Halley Station, a geophysical observatory on the Brunt Ice Shelf. Conditions at Halley are particularly suitable since it provides an almost unobstructed view of the horizon in every direction through an exceptionally clean atmosphere. The photographs were taken just before local noon, two days before the sun set prior to the three-month polar night; the red glow of dawn could be clearly seen traversing the horizon.

Gao, X.-H., Yu, W.-B., Stanford, J.L., **Global features of the semiannual oscillation in stratospheric temperatures and comparison between seasons and hemispheres,** *Journal of the atmospheric sciences,* Apr. 1, 1987 44(7), p.1041-1048, 20 refs.

Four years of satellite-derived microwave and infrared radiances are analyzed for the three-dimensional and seasonal variation of semiannual oscillations (SAO) in stratospheric temperatures, with particular focus on high latitudes, to investigate the effect of stratospheric warmings on SAO. Separate analyses of individual seasons in each hemisphere reveal that the strongest SAO in temperature occur in the Northern Hemisphere (NH) winter polar upper stratosphere. These results, together with the latitudinal structure of the temperature SAO and the fact that the NH polar SAO is nearly out of phase with the lower latitude SAO, are consistent with the existence of a global-scale, meridional circulation on the SAO time scale. The results suggest that polar stratospheric warmings are an important source of SAO in both high and low latitude stratospheric temperature fields. Interannual variations, three-dimensional phase structure, and zonal asymmetry of SAO are also detailed. The SH stratospheric SAO is dominated by a localized feature in the high-latitude, eastern hemisphere which tilts westward with height. (Auth.)

Dolgin, I.M., ed, **Climate of Antarctica. Papers presented at the All-Union Symposium on the Study of the Climate of Antarctica,** New Delhi, Oxonian Press, 1986, 213p., For Russian original see 35-2178 or 12I-24432. Refs. passim. For individual papers see 41-3949 through 41-3954 or F-35828, I-35815 through I-35827, and I-35829 through I-35845.

The papers in this collection were presented at a conference on antarctic climatology. Analysis of data collected during long-term studies made possible the refinement of current ideas of meteorological regime, circulation and atmospheric structure in southern polar regions. Much attention is devoted to new aspects of climatology: questions of heat and moisture balance, circulation mechanisms, and upper atmosphere research using rockets. Radiation, albedo, ice sheet mass balance, ice distribution, and ozone, CO, and methane concentration in the atmosphere are also investigated.

Milashenko, G.P., Grigor'ian, V.A., **Cloud fields over Antarctica from satellite data,** Climate of Antarctica. Papers presented at the All-Union Symposium on the Study of the Climate in Antarctica. Edited by I.M. Dolgin, New Delhi, Oxonian Press, 1986, p.102-108, For Russian original see 12I-24448. 5 refs.

Data on cloud cover gathered by satellite from 1970-1975 in the Antarctic are analyzed. It is established that cloud cover distribution is zonal over the ocean and follows the coastline near the continent. Comparison of satellite data and visual observations of cloud cover indicates some disparity in the results, especially when cloud cover is light. (Auth. mod.)

Briazgin, N.N., **Method of preparing monthly charts of atmospheric precipitation in Antarctica,** Climate of Antarctica. Papers presented at the All-Union Symposium on the Study of the Climate in Antarctica. Edited by I.M. Dolgin, New Delhi, Oxonian Press, 1986, p.109-116, For Russian original see 35-2183 or 12I-24449. 5 refs.

Error in measuring precipitation in Antarctica and ways to reduce it are discussed. Graphs of the annual precipitation pattern based on corrected mean totals from key stations are given. Monthly precipitation charts are constructed by using these graphs and snow-accumulation results. Variability of annual total precipitation is considered. (Auth. mod.)

I-35832
Voskresenskiĭ, A.I., Chukanin, K.I., **Structure of thermal fields of the free atmosphere over Antarctica,** Climate of Antarctica. Papers presented at the All-Union Symposium on the Study of the Climate in Antarctica. Edited by I.M. Dolgin, New Delhi, Oxonian Press, 1986, p.117-124, For Russian original see 12I-24450. 5 refs.

Several new features of temperature fields in the antarctic atmosphere are examined. On the basis of a spatial and temporal analysis of these fields areas in which the cold continent exerts an influence are shown, average temperatures at coastal and continental stations compared, and the most pronounced seasonal temperature changes, especially in the 200-50 millibar zone identified. Several phenomena associated with restructuring of the antarctic atmospheric temperature field begin in the Australian sector. (Auth. mod.)

I-35833
Smirnova, I.P., **Peculiarities of the empirical distribution of air temperature in the free atmosphere over Antarctica,** Climate of Antarctica. Papers presented at the All-Union Symposium on the Study of the Climate in Antarctica. Edited by I.M. Dolgin, New Delhi, Oxonian Press, 1986, p.125-131, For Russian original see 12I-24451. 3 refs.

Typical features of spatial and temporal variability of asymmetry coefficients and excess are described. It is shown that magnitude and sign of asymmetry reflect the most characteristic features of temperature regime structure in the area. For smoothing the frequencies, better results are obtained, in a majority of cases, by expansion in Gram-Charlier series, by taking into account the coefficients of skewness and kurtosis. This is revealed by the results of approximation and estimation of the satisfactory fit between the theoretical and empirical distributions. (Auth. mod.)

Voskresenskiĭ, A.I., Sveshnikov, A.M., **Statistical analysis of the temperature regime of the atmosphere over Antarctica,** Climate of Antarctica. Papers presented at the All-Union Symposium on the Study of the Climate in Antarctica. Edited by I.M. Dolgin, New Delhi, Oxonian Press, 1986, p.132-136, For Russian original see 12I-24452. 5 refs.

Temperature and wind radiosonde data from 4 Soviet and 13 other stations from 1957-1970 were analyzed to determine the distribution of atmosphreric temperature variability in the antarctic atmosphere. The greatest degrees of temperature variation occur in the stratosphere during the spring restructuring of the thermobaric field. This process begins in the Indian-Australian sector and spreads over the entire continent. (Auth. mod.)

Ryzhakov, L.IU., **Peculiarities of seasonal reversal of pressure and temperature fields of the Southern Hemisphere,** Climate of Antarctica. Papers presented at the All-Union Symposium on the Study of the Climate in Antarctica. Edited by I.M. Dolgin, New Delhi, Oxonian Press, 1986, p.193-199, For Russian original see 12I-24461. 3 refs.

It is shown that features of the annual pattern of air pressure and temperature are determined by seasonal atmospheric circulation restructuring over Antarctica linked to Southern Hemisphere macroprocesses. A dual wave was noted over Antarctica at the 500 millibar level over a year's time and a semiannual wave is seen in air temperature variation. (Auth. mod.)

I-35844
Lysakov, E.P., **Mass balance and mean meridional circulation of the atmosphere over Antarctica,** Climate of Antarctica. Papers presented at the All-Union Symposium on the Study of the Climate in Antarctica. Edited by I.M. Dolgin, New Delhi, Oxonian Press, 1986, p.200-207, For Russian original see 12I-24462. 6 refs.

Complex studies of air masses over Antarctica both for the entire continent and its separate layers were done on the basis of long-term data. A mechanism is established of regular meridional transfer across the antarctic boundary as a basic factor controlling air mass balance of the south polar area. The structure of the polar circulation nucleus is qualitatively described; mass transfer within this is effected by large-scale sinking throughout the depth of the 20-km atmospheric column studied. (Auth. mod.)

Mo, K.C., Pfaendtner, J., Kalnay, E., **GCM study on the maintenance of the June 1982 blocking in the Southern Hemisphere,** *Journal of the atmospheric sciences,* Apr. 15, 1987 44(8), p.1123-1142, 36 refs.

General Circulation Model (GCM) experiments have been performed to determine mechanisms that maintained the blocking episode in the Australian-New Zealand region during the period June 8-22, 1982. A control forecast reproduces the persistent ridge. Several mechanistic experiments lead to the following conclusions: the block was not due to orographic forcing, which has only a small local influence on the winter atmospheric circulation in the Southern Hemisphere; the block was not produced by the sea surface temperature anomalies (SST); the block was not a response to tropical heating or the Asian Monsoon; the most important boundary forcing maintaining this blocking ridge is heating associated with the land-sea contrast; the daily spectral energetics of the control experiment suggests that the baroclinic amplification of planetary-scale waves forced by synoptic-scale disturbances played an important role in the evolution of this blocking process. High-latitude sensible heating associated with cold air outbreaks from Antarctica are also important in maintaining the block. (Auth. mod.)

I-35885
Shell, E.R., **Watch this space,** *Omni,* Aug. 1987 9(11), p.36-42, 80-81.

The history of the discovery, possible consequences, and research related to stratospheric ozone losses over Antarctica are reviewed. The NASA plan to fly a group of pilots into the heart of the antarctic vortex, to take samples of the hole and gather data to help experts on the ground determine how much ozone has vanished and what chemical process is involved, is described. Nine pictures, generated by the Nimbus 7 total ozone mapping spectrometer showing the Southern Hemisphere ozone hole expanding over a period of time from Sep. 16 to Oct. 2, 1986, are included.

Uruguay. Dirección Nacional de Meteorología, **Meteorological investigations in Antarctica** [Investigación científico-meteorológica en la Antártida], *Montevideo. Instituto Antártico Uruguayo. Actividad científica, 1985/86,* Mar. 20, 1987 Vol.1, p.10-12, In Spanish with English summary.

Uruguay's research activities in the Antarctic are carried out by the National Meteorology Directorate in coordination and cooperation with the Uruguayan Antarctic Institute, whose principal aim is to identify the typical synoptic configurations which evolve over the southern part of South America and their relation to meteorological phenomena which occur in Uruguay. As a part of program implementation, the meteorological station Dinamet-Uruguay was installed at the Artigas Station on King George I. A table showing climatological data for Mar. 1 through July 31, 1986, is included in an appendix.

I-35899
Van der Veen, C.J., **Ice sheets and the CO2 problem,** *Surveys in geophysics,* Mar. 1987 9(1), p.1-42, Refs. p.40-42.

In this review, the carbon dioxide problem is discussed, with special reference to the possible effects of a global warming on the ice sheets of Greenland and Antarctica. Instead of detailed projections of future climate and the consequences, the basic mechanisms are explained and illustrated with results described in the literature. It is concluded that a doubling of the atmospheric CO2 content (most likely to occur somewhere in the second half of the next century) will result in a globally-averaged warming of 2-4 C, and an intensification of the hydrologic cycle. In the polar regions, this warming will be a few degrees larger and as a consequence the Greenland Ice Sheet will decrease in size. Antarctica, on the other hand, is expected to grow because of the increased snowfall. The instability of the West Antarctic Ice Sheet is also discussed and, although no conclusive prediction to its long-term response can be made, it is argued that on a short time scale (less than about 100 y) nothing dramatic will happen to this part of Antarctica. (Auth.)

Lysakov, E.P., **Atmospheric circulation in the Atlantic sector of the southern ocean according to results of the "Weddell-POLEX-81" expedition** [Atmosfernaia tsirkuliatsiia nad atlanticheskim sektorom IUzhnogo okeana (rezul'taty eksperimenta "Uedell-POLEX-81")], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1986 Vol.108, p.45-49, In Russian.

Results of monitoring atmospheric circulation over the central portion of the Atlantic sector of the southern ocean, from Oct. 18 through Nov. 15, are presented. Basic findings, related to the intensity of zonal vs. meridional circulation, cloudiness, cyclonic systems, pack ice, and formation of polynyas, are discussed.

I-35938
Lutsenko, E.I., **Disruption of zonal atmospheric circulation over the southern ocean** [O narusheniiakh zonal'nosti atmosfernoĭ tsirkuliatsii nad IUzhnym okeanom], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1986 Vol.108, p.49-52, In Russian. 5 refs.

Areas with most active development of blocking processes in the Southern Hemisphere are discussed, based on analysis of the properties of spatial amplitude distribution of annual pressure variations over the ocean, which is shown on a chart along with the position of main climatic cyclone centers.

I-35939
Lysakov, E.P., Sveshnikov, A.M., **Influence of atmospheric circulation on the formation of Weddell polynya** [O vliianii atmosfernoĭ tsirkuliatsii na formirovanie polyn'i Ueddella], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1986 Vol.108, p.52-56, In Russian. 2 refs.

A table showing the meridional pressure gradient in the 50-65 deg S zone over the Atlantic sector of the southern ocean, for the periods 1971-1973, 1974-1976 and 1977-1979, is discussed. The conclusion is derived from the above analysis, based mainly on the annual variations of wind currents in the Maud Rise region, that such currents have a definite influence on the formation of polynyas in that area.

I-35940
Lutsenko, E.I., **Structure of atmospheric processes and its relation to some oceanographic features in the Atlantic Ocean** [Struktura atmosfernykh protsessov v sviazi s nekotorymi okeanograficheskimi osobennostiami atlanticheskogo sektora IUzhnogo okeana], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1986 Vol.108, p.56-61, In Russian. 7 refs.

Atmospheric processes were studied in the Atlantic and Indian oceans around the Antarctic Peninsula and along the southern coast of the continent. Charts showing the recurrence (number of events) of migratory cyclones in Jan. 1984 and the primary zone of cyclogenesis, as well as the pressure distribution at sea level on Jan. 19, 1984, are presented and discussed. Zonal circulation patterns are more frequently broken in winter than in summer; cloud vortices occur twice as frequently in winter as in summer. Their number is greatest at latitude 50-60S.

Lal, M., Jain, A.K., Sinha, M.C., **Possible climatic implications of depletion of antarctic ozone,** *Tellus,* July 1987 39B(3), p.326-328, 12 refs.

The total amount of ozone overhead in late winter and early spring has decreased considerably during the past decade. Recent satellite data confirm that the column abundances of ozone above Antarctica are among the lowest recorded anywhere on the globe. Our radiative-convective model calculations demonstrate that this depletion of antarctic ozone could lead to a surface cooling of about 0.47K which is in contrast to that observed from climatological temperature records. This calls for a detailed investigation of the air chemistry in relation to dynamic-radiative balance for the antarctic atmosphere. (Auth.)

I-35954
Cicerone, R.J., **Changes in stratospheric ozone,** *Science,* July 3, 1987 237(4810), p.35-42, Numerous refs.

The ozone layer in the upper atmosphere is a natural feature of the earth's environment. It performs several important functions, including shielding the earth from damaging solar ultraviolet radiation. Far from being static, ozone concentrations rise and fall under the forces of photochemical production, catalytic chemical destruction, and fluid dynamical transport. Human activities are projected to deplete substantially stratospheric ozone through anthropogenic increases in the global concentrations of key atmospheric chemicals. Human-induced perturbations may be occurring already.

Jacka, F., Argall, P.S., **Lidar system for stratosphere studies—Performance simulation,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.226-235, 9 refs.

A brief description is presented of a lidar system which is currently under construction. This lidar will be used to study the structure and dynamics of the atmosphere in the height range 5 to 70 km; its expected performance is discussed. The simulations presented here relate to determinations of density, temperature and wind from the back-scattered intensity; and wind and temperature from the line profile of the back-scattered light. Attention is drawn to the importance of the lidar technique for application in the Antarctic, along with existing facilities, especially if it is combined with measurements on the active minor constituents of the stratosphere. (Auth.)

Lockwood, J.G., **Ice calving, carbon dioxide and control of ice ages,** *Progress in physical geography,* 1985 9(1), p.89-96, 26 refs.

The literature on ice calving, carbon dioxide, and the control of ice ages published during the past decade is reviewed. Various ice sheet models for the last 100 yr are grouped into 3 types, and the results of their use in studying past climates are reviewed. The variation in atmospheric carbon dioxide content during the last glacial-to-interglacial climatic transition is revealed by Greenland and antarctic ice cores and deep sea cores. The atmosphere-ocean carbon dioxide cycle and the effect of CO2 on climate and ice sheet melting are reviewed. It is concluded that variations in atmospheric CO2 may provide an additional, or alternative, mechanism to Pollard's ice sheet calving mechanism for causing the rapid retreat of continental ice sheets.

I-36013

Japanese Antarctic Research Expedition, **Antarctic meteorological data. Vol.26. Meteorological data at the Syowa Station in 1985,** Tokyo, Japan Meteorological Agency, [1987], 258p.

This set of 1985 data collected at Showa Station includes surface reports comprised of monthly and daily summaries and synoptic data: aerological data comprised of monthly summaries and upper air observations; global solar radiation measurements comprised of monthly summaries and hourly readings; and atmospheric turbidity measurements comprised of daily, monthly, and extreme readings.

I-36014

Japanese Antarctic Research Expedition, **Antarctic meteorological data. Special volume No.4. Total amount of ozone (1981-1985); vertical ozone (sonde) (1981-1984); long wave radiation (1981-1983),** Tokyo, Japan Meteorological Agency, [1986], 60p., 3 refs.

This volume contains atmospheric ozone and long wave radiation data at Showa Station for the period 1981-1985. The atmospheric ozone data are divided into vertical and total values; the former were obtained with ozonosondes and the latter with ozone spectrophotometers. Long-wave radiation data were obtained with long wave radiation sondes. The types of instruments are listed and illustrated.

Jones, P.D., Limbert, D.W.S., **Data bank of antarctic surface temperature and pressure data,** *U.S. Department of Energy. Technical report,* June 1987 DOE/ER/60397-H2, 52p., 19 refs.

A data bank of monthly mean surface air temperature and sea-level or station-level pressure is presented for 29 stations over the antarctic region south of 60 S. Considerable attempts have been made to locate missing data in nationally published sources and in World Weather Records. By cross-checking neighboring station data, suspect values have been either verified or corrected. At 4 sites in the Antarctic Peninsula region, composite records were produced by amalgamating records from a number of short and longer length records at or near the key sites. The 4 sites were Bellingshausen, Faraday, Esperanza and Rothera. The mean antarctic temperature series produced by Raper et al. (1984) is updated using the same method of calculation. (Auth.)

Saxena, V.K., Ruggiero, F.H., **Microstructure of antarctic coastal clouds,** International Cloud Physics Conference, 9th, Tallin, Aug. 21-28, 1984. Proceedings, Vol.1, Tallin, Valgus, 1984, p.51-54, 19 refs.

During Oct.-Nov. 1980 and Dec. 1982-Jan. 1983, the Cloud Aerosol Interaction Lab (CAIL) of North Carolina State University participated in field experiments over the antarctic coast for investigating the cloud microstructure. In particular, measurements of the microphysical parameters of antarctic coastal stratus clouds were made. The objective of the field study were determination of the cloud nucleation characteristics of aerosols particles that participate in the formation of antarctic coastal clouds, and study of variations in the cloud droplet size spectra through direct measurements within the clouds. Observations of the activity spectrum of cloud condensation nuclei in the substratus layer with simultaneous observations of cloud droplet size distribution were used to analyze recent models proposed for the evolution of the cloud droplet spectra. This is accomplished by examining the correlation between the CCN activity spectrum and the droplet size spectrum. (Auth. mod.)

Russell-Head, D.S., Budd, W.F., **Casey snow runway meteorological records, 1984,** *Melbourne. University. Programme in Antarctic Studies. MUPAS report,* June 1987 No.66, 98p.

This report consists of the set of meteorological and glaciological data collected at site of the proposed Casey Station compressed snow runway during Jan. and Feb. 1984. The data is presented in numerical and graphical form. The parameters measured are air temperature, snow temperatures at depths of 0.1 m, 0.2 m, 0.5 m, and 1.0 m, solar radiation, wind speed and direction. The data were collected every 15 minutes from 19 Jan. to 8 Feb. Snow temperatures from 19 to 25 Jan. are not reliable because the snow in which the sensors were buried had become contaminated by ash from a fire. The snow temperatures from 29 Jan. were recorded in virgin firn and are reliable. Apart from the problems with the snow temperatures, the data set is fairly complete and forms a good record of the local meteorological conditions. (Auth. mod.)

Smith, V.R., **Chemical composition of precipitation at Marion Island (sub-Antarctic),** *Atmospheric environment,* 1987 21(5), p.1159-1165, Refs. p.1164-1165.

Over a 1-year period 16.40 g Cl/sq m, 10.35 g Na/sq m, 2.11 g SO4-S/sq m, 1.24 g Mg/sq m, 0.39 g K/sq m, 0.37 g Ca/sq m and 0.21 g inorganic N/sq m were deposited in precipitation 450 m inland on the eastern coastal plain of Marion I. Dissolved PO4-P and organic forms of N were not detected in the precipitation samples. Concentrations of Cl, Na, Mg, Ca and K, as well as the total ionic concentration in the precipitation samples were significantly negatively correlated with the amount of precipitation. The ionic concentration order (Cl>Na>SO4-S>Mg>K=Ca) in the precipitation was very similar to that in the surrounding ocean. It is likely that most of the inorganic N found in the precipitation originated in penguin rookeries in the nearby shore zone. A comparison is made between precipitation inputs of nutrients at the island and those at other subpolar sites in the S and N Hemispheres. (Auth.)

King, J.C., Mobbs, S.D., Darby, M.S., Rees, J.M., **Observations of an internal gravity wave in the lower troposphere at Halley, Antarctica,** *Boundary-layer meteorology,* Apr. 1987 39(1/2), p.1-13, 11 refs.

Observations of internal gravity waves in the stably-stratified atmospheric boundary layer at Halley Station are presented. These were made on Feb. 1, 1986 and take the form of temperature measurements from a 30 m mast and a Sodar record. The temperature record shows a clearly defined, dominant wave period of around 11 min. A high-resolution radiosonde ascent made during the period of wave activity exhibits thin layers of low Richardson number and it is suggested that these are regions of dynamic instability where the waves are generated. A linear stability analysis of the radiosonde data supports this idea. It is argued from simple theoretical ideas and by means of a numerical model that only waves with a wavelength greater than a certain critical value are likely to be observed at the surface. The observations are shown to be consistent with this hypothesis. (Auth.)

Kratke, J., Wielbińska, D., **Vertical wind profile under small velocity conditions over Admiralty Bay, King George Island, West Antarctica,** *Polish polar research,* 1987 8(1), p.75-83, 9 refs.

The analysis of speed and direction distribution of upper wind in the layer up to 3500 m was carried out on the basis of pibal ascents performed over the Admiralty Bay. Results show that with northwesterly, westerly and southwesterly winds the velocities increase with height. Surface wind velocities are greater than in the 100-300 m layer; minimum velocities are also observed at 1300-1700 and at 2200 m. A considerable number of days with easterly air flow occur in the Antarctic Peninsula. (Auth. mod.)

I-36155
Brasseur, G., **Endangered ozone layer,** *Environment,* Jan./Feb. 1987 29(1), p.6-11, 39-45, 25 refs.

The report in 1985 of a springtime "ozone hole" in the stratosphere above Antarctica stimulated new programs of research on atmospheric chemistry and dynamics. It also triggered widespread popular speculation as to the causes and effects of whatever processes accounted for the hole. This article reviews the present state of knowledge, the major uncertainties about what is happening, and the array of hypotheses put forward to explain these events and their implications for the future. (Auth.)

Bojkov, R.D., **Spring-ozone change in Antarctica and the role of the polar vortex,** *Advances in space research,* 1986 6(10), p.89-98, 15 refs.

Observations since the late 1970's have shown that from late Sep. until the end of Nov. the total ozone over the southern polar region has declined by up to 30% when compared with the ozone average of the 1957-1978 period. Satellite observations confirm that the significant ozone decline is centered over and does not expand outside of the antarctic continent, e.g. it coincides with the location of the antarctic stratospheric winter vortex; moreover, the decline increases poleward. Analysis of the stratospheric temperatures and geopotential heights confirms that the spring-to-spring ozone changes closely follow the changes of the thermobaric field, and that the rapid increase of ozone (and stratospheric temperature) in the spring is dependent on the time of the polar vortex breakdown, when favorable conditions for continuous meridional exchange of ozone-rich air from the middle vortex central region during early spring provide favorable conditions for weak upward motions, responsible for a substantial part of the ozone loss between the date of the solar penetration of the stratos-

phere, and the date of the vortex breakdown. Since the late 1970's, the breakdown of the antarctic vortex has occurred about mid-Nov., a month later than in years of early breakdown. It is suggested that an early breakdown of the antarctic vortex would interrupt the trend of declining spring ozone established over the past few years. (Auth.)

Mount, G.H., Sanders, R.W., Schmeltekopf, A.L., Solomon, S., **Visible spectroscopy at McMurdo Station, Antarctica. 1. Overview and daily variations of NO2 and O3, austral spring 1986,** *Journal of geophysical research,* July 20, 1987 92(D7), p.8320-8328, 27 refs.

Observations of the visible spectra of the sun and moon were obtained at McMurdo Station, Antarctica, during austral spring in 1986. The data coverage and observing conditions are described. Daily variations of ozone suggest that the bulk of the springtime ozone depletion (or the antarctic ozone "hole") occurs rapidly during early Sep. Total NO2 abundances were remarkably low during Aug. and Sep. inside the polar vortex and displayed a near-absence of diurnal variation from morning to evening twilight. The total NO2 column abundance was closely correlated to 50-mbar temperatures. (Auth.)

Solomon, S., Mount, G.H., Sanders, R.W., Schmeltekopf, A.L., **Visible spectroscopy at McMurdo Station, Antarctica. 2. Observations of OClO,** *Journal of geophysical research,* July 20, 1987 92(D7), p.8329-8338, 24 refs.

The column abundance of OClO at McMurdo Station, Antarctica, was measured by visible absorption spectroscopy during austral spring in 1986. Observations were obtained during the day using scattered sunlight and at night using direct light from the moon. The observed total column amounts in Antarctica were about 20-50 times larger than would be expected for standard homogeneous photochemistry, suggesting that the halogen chemistry of antarctic spring is profoundly different from such standard theoretical expectations and may play a role in the development of the springtime antarctic ozone "hole."

Sanders, R.W., Solomon, S., Mount, G.H., Bates, M.W., Schmeltekopf, A.L., **Visible spectroscopy at McMurdo Station, Antarctica. 3. Observations of NO3,** *Journal of geophysical research,* July 20, 1987 92(D7), p.8339-8342, 16 refs.

The total column abundance of NO3 was measured in Antarctica during the nights of Sep. 17-19, 1986, by visible absorption, using the moon as the light source. The variation of the observed abundance with lunar zenith angle suggests that the bulk of the layer is located in the stratosphere. In agreement with theoretical model calculations, the total column was about 20 trillion molecules/sq km and increased systematically with time during the night. (Auth.)

Wendler, G., **"Radiation paradox" on the slopes of the antarctic continent,** *Polarforschung,* 1986 56(1/2), p.33-41, With German summary. 19 refs.

Detailed radiative measurements were carried out during the austral summer of 1985/86 in Adélie Land, Eastern Antarctica. The station was located some 100 km from the coast at an altitude of 1560 m on the slope of the Antarctic Ice Sheet. It was found that with increasing global radiation the all wave radiation budget decreased. Similar results in Greenland were called the "radiation paradox". Prerequisite for this occurrence is a high surface reflectivity. A mean albedo of 82% was observed at the site. Under these circumstances, the increase in the sort wave radiation with decreasing cloudiness is over-compensated by the increased long wave radiative losses. A simple model was developed which showed that under these conditions, an albedo above 60.1% had to be present to observe this phenomenon. (Auth.)

Raschke, E., Jacobs, H., Lutz, H.-J., Steffens, U., **Identification of clouds over Antarctica from satellite imagery** [Wolkenerkennung über der Antarktis in Satellitenbildern], *Polarforschung,* 1986 56(1/2), p.69-78, In German with English summary. 14 refs.

Detailed analyses of the multispectral data of the AVHRR in the operational NOAA satellites demonstrate their usefulness to map clouds even over the highly reflecting snowfields of Antarctica. With this procedure a contrast enhancement is performed making use of the different spectral reflectance, transmittance and emittance properties respectively, of clouds and the surface below within the spectral ranges of the AVHRR. The measurements within the range between 3.5 and 3.9 micron (channel 3), which unfortunately are highly noisy during night-time, play a key role here. Results of some initial case studies demonstrate that a computer-aided identification of water and ice clouds over Antarctica and adjacent ocean and sea-ice fields is possible, where even sea-ice beneath optically thinner cloud-decks can be mapped. This procedure should be useful for operational use to analyze ISCCP data sets. (Auth.)

Wada, M., **Formation mechanisms of clouds during high pressure conditions in the coastal region of Antarctica,** *Meteorological Society of Japan. Journal,* June 1987 Ser.II,65(3), p.483-495, With Japanese summary. 15 refs.

Analyzing the aerological data at Showa Station and the surface data at Showa Station and Mizuho Stations in 1979, the mechanism of cloud formation during high-pressure conditions is discussed. It was frequently (over 30%) overcast during high-pressure conditions at Showa except in Dec., and a similar tendency can be found at Mizuho. Moreover, snowfalls were observed at Showa even in these conditions and the frequency of such days was rather larger in winter than in summer. In many cases of high-pressure, a stable layer or an inversion layer was found; some stable layers were around the 800 mb level and others were near the surface. It was considered that the formation and development of clouds was connected directly with the stable layers. The main mechanisms for forming clouds would be the weak convection in the layer below a stable layer or inversion layer, the mixing of cold air with moist air because of wind shear and surface radiative cooling; for developing clouds the mechanism would be radiative cooling at the cloud top. (Auth.)

Lysakov, E.P., **Localization of meridional disturbances of the atmospheric circulation in the Antarctic** [Lokalizatsiia meridional'nykh vozmushcheniĭ atmosfernoĭ tsirkuliatsii nad Antarktidoĭ], *Sovetskaia antarkticheskaia ekspeditsiia. Trudy,* 1986 No.81, p.45-50, In Russian. 3 refs.

Through the analysis of the trajectories of cloud vortexes and the distribution of frontal cloudiness it is found that the strongest meri-

dional disturbance of the atmospheric circulation occurs in the Pacific sector and over Marie Byrd Land. It is suggested that this part of the coast is the source of energy supply to the atmospheric column over Antarctica, through the incorporation of warm and humid masses, and their subsequent distribution over the continent.

Sokolov, S.T., **Meteorological conditions at Druzhnaya Base in summer 1980** [Meteorologicheskie usloviia v raĭone bazy Druzhnoĭ letom 1980 g.], *Sovetskaia antarkticheskaia ekspeditsiia. Trudy,* 1986 No.81, p.63-77, In Russian. 7 refs.

Meteorological characteristics and synoptic processes over the southern Weddell Sea and the adjacent Filchner and Ronne ice shelves, in Jan.-Mar. 1980, are described. The data are compared with data obtained in previous years. Significant influence on the relatively mild climate of West Antarctica is attributed to topographic features of the area, such as the Pensacola Mountains, the mountains of the southern Antarctic Peninsula, and Berkner I.

I-36202
Kodama, Y., **Katabatic winds in Adélie Land,** Fairbanks, University of Alaska, 1985, 191p., University Microfilms order No.87-04873, Ph.D. thesis. Refs. p.181-191.

Data from Automatic Weather Stations (AWS) on Adélie Land were analyzed, showing the following: the high directional constancy of surface winds was found at the slope stations even in summer, when the inversion is weak or destroyed; synoptic geostrophic winds and eddy viscosity also effect the constancy of the wind direction in summer; wind directional constancies at the slope stations in winter are sometimes lower than the mean annual constancies. These low constancies are associated with warm air advection from maritime air brought into Adélie Land, when the continental anticyclonic ridge lies to the east of it. There is a superadiabatic surface temperature change between the high plateau and intermediate plateau stations, which could be of importance for surface flow when the buoyancy component is balanced or nearly balanced by an increase in depth of the katabatic wind layer. The entrainment of blowing snow particles increases the density of the katabatic flow layer by 2 mechanisms: the addition of snow particles to the air column, and the sublimation of the snow particles. This increase in density in the katabatic flow layer leads to increased wind speed, which occurs primarily at wind speeds exceeding 12 m/s when there is, usually, a large amount of blowing snow. Elliott, S., Rowland, F.S., **Chlorofluorocarbons and stratospheric ozone,** *Journal of chemical education,* May 1987 64(5), p.387-391, 8 refs.

The physical atmospheric chemistry behind chlorofluorocarbon-ozone relationships is reviewed, first from a historical perspective, and then with consideration of the ozone hole discovered over Antarctica. It is noted that ozone hole development closely coincides with the rise in atmospheric chlorine content induced by CFC emission. However, it is emphasized that any mechanism relating chlorine and the ozone hole must be unique to the Antarctic. The role of clouds in the chlorine mechanisms advanced so far is discussed.

Aleksandrov, A.S., **Inspection of Mirnyy Station** [Inspektsiia meteorologicheskoĭ stantsii Mirnyĭ], *Sovetskaia antarkticheskaia ekspeditsiia. Trudy,* 1986 No.80, p.143-144, In Russian. 1 ref.

An inspection of Mirnyy Station during the 23rd Soviet Antarctic Expedition is described. It included a reconnaissance of the station grounds, equipment, meteorological instruments, personnel, and evaluation of the data collected. The inspection showed that the topography of the station location is typical of that region and well suited for long-term meteorological observations. However, the construction sites surrounding the meteorological platform impair those observations by greatly obstructing the horizon, especially on the northwestern side. Consequently, data on snow cover thickness, solar radiation, and direction and speed of wind often reflect a local, rather than a general, meteorological regime.

Albuquerque Cavalcanti, I.F. de, **Interaction between Antarctica and the atmospheric circulation near South America** [Interações entre a Antártica e a circulação da atmosfera próxima à América do Sul], *Academia Brasileira de Ciencias. Anais,* 1986 58(1-Suppl.), p.171-179, In Portuguese with English summary. 17 refs.

Features of atmospheric circulation near South America are analyzed and related with variations of meteorological parameters to some regions of Antarctica. The empirical orthogonal functions method is applied and the eigenvectors patterns are related to synoptic situations that affect South America. Pressure in Antarctica shows similar variations to the 4th circulation eigenvector. When pressure is higher in Antarctica, the jet stream is in lower latitudes, and the synoptic systems tend to pass over Brazil. (Auth.)

Pereira, E.B., Nordemann, D.J.R., Vasconcellos, M.B.A., **Atmospheric radon measurements in the Antarctic Peninsula: a preliminary report,** *Academia Brasileira de Ciencias. Anais,* 1986 58(1-Suppl.), p.181-186, 17 refs.

Atmospheric radon and radon daughter products were measured on board the *Barão de Teffé* cruising from King George I. to the Brazilian coast in summer 1983-1984. An average of 2.1 pCi/cu m was obtained for radon in the Antarctic Peninsula region. The Drake Passage contributed with only 1.3 pCi/cu m. Large short term fluctuations superimposed on a slow steady concentration decrease with time emphasized the need of additional long-term data for more thorough studies. The radon daughters collected on aerosol filters kept the same long-term concentration decrease with time but no short-term correlations were found. INAA performed on returned filters conformed the expected preferential maritime origin of these aerosols with an average Cl/Na of 1.83. (Auth. mod.)

Villela, R.J., **Results of synoptic analysis aboard R/V *Prof. W. Besnard* in the 1st and 2nd Brazilian antarctic expeditions,** *Academia Brasileira de Ciencias. Anais,* 1986 58(1-Suppl.), p.187-204, 15 refs.

Surface synoptic charts were analyzed daily aboard R/V *Prof. W. Besnard* during the 1982-83 and 1983-84 summer seasons. Plotted were surface and upper air analyses and prognostic charts transmitted in coded forms by Chilean and Argentine forecasting offices, and by Frei Antarctic Meteorological Center. The onboard radio equipment and the sources of meteorological data broadcasts are described.

Several selected synoptic situations are discussed in detail. The Drake Passage conditions and the evidences found for the low-level cold inertial jet stream in the Antarctic Peninsula area (as described by Parish and Schwerdtfeger, 1977) are particularly stressed. A probable link between synoptic systems in the Antarctic and cold fronts in Brazil observed in Jan. 1983 is discussed. (Auth. mod.)

I-36258

Villela, R.J., Festa, M., **Meteorological observations aboard R/V *Prof. W. Besnard* during the 1st and 2nd Brazilian antarctic expeditions,** *Academia Brasileira de Ciencias. Anais,* 1986 58(1-Suppl.), p.205-218, 8 refs.

Results of surface meteorological observations made aboard R/V *Prof. W. Besnard* during the 1st and 2nd Brazilian antarctic expeditions are reported. The extreme and mean values, and frequencies of several elements observed south of 60 S are presented and discussed. More adverse conditions, such as strong winds, snow, rain and fog, were observed in the first phase of the 1st expedition (Jan. 8 to 19, 1983) and in the second phase of the 2nd expedition (Feb. 19 to 25, 1984). Fewer icebergs were seen in the 2nd expedition than in the 1st. The cold, low-level inertial jet stream around the northeastern extremity of the Antarctic Peninsula, originating in the Weddell Sea appeared to be related to some of the colder temperatures observed from the ship. (Auth. mod.)

Flohn, H., **Role of large-scale ice sheets in climatic history,** *International Association of Hydrological Sciences. Publication,* 1987 No.170, International Symposium [on] the Physical Basis of Ice Sheet Modelling, Vancouver, B.C., Aug. 9-22, 1987. Proceedings. Edited by E.D. Waddington and J.S. Walder, p.231-241, Refs. p.239-241., With French summary.

The climatic history of the earth contains two periods of some 10,000,000 years length during which a continent in polar latitudes was partly or totally glaciated, while the opposite hemisphere was essentially ice-free. The present glaciation of Antarctica started about 38 Ma BP, preceding those of the northern continents by more than 30 MA. The climatogenetic role of this hemispheric asymmetry is outlined, as well as the role of variations in the composition of the atmosphere. Together with the varying land-sea distribution in polar latitudes, the latter primarily control the climatic history of the planet Earth. (Auth.)

Hills, A.J., Cicerone, R.J., Calvert, J.G., Birks, J.W., **Kinetics of the BrO+ClO reaction and implications for stratospheric ozone,** *Nature,* July 30, 1987 328(6129), p.405-408, 15 refs.

The gas-phase reaction between BrO and ClO has been proposed as a potentially fast and synergistic mechanism of stratospheric ozone destruction. Further, it has been advanced as a contributing factor to antarctic springtime ozone column losses of about 40% from 1960 to 1985. Both dynamical and chemical theories have been advanced to explain the formation of the antarctic 'ozone hole'. A major uncertainty in these theories has been the rate constant and product distribution of the BrO+ClO reaction as a function of temperature. Reported here are the first direct measurements of these parameters. It is shown that this reaction could, indeed, account for a large fraction of the springtime ozone depletion over Antarctica and provide a source of chlorine dioxide of sufficient magnitude to explain the recent measurements of this species in the antarctic stratosphere, provided that the stratosphere contains a sufficient quantity of bromine (about 20 p.p.t.v.). (Auth.)

De Zafra, R.L., **High concentrations of chlorine monoxide at low altitudes in the antarctic spring stratosphere: diurnal variation,** *Nature,* July 30, 1987 328(6129), p.408-411, 19 refs.

The Stony Brook ground-based remote sensing mm-wave spectrometer was used to measure chlorine monoxide in the stratosphere over McMurdo Station during the austral spring of 1986. The data collected show strong evidence for abnormally high concentrations of ClO at low altitudes—as much as two orders of magnitude greater than standard theories predict at 20-km altitude of mid-latitudes. This low-altitude ClO changes cyclically on a diurnal basis, and also secularly during the Sep.-Oct. observing period. A study of this diurnal variation of the low-altitude ClO is presented. It is concluded that chlorine is crucially involved in the springtime destruction of antarctic ozone. (Auth.)

I-36322

Solomon, P.M., **High concentrations of chlorine monoxide at low altitudes in the antarctic spring stratosphere: secular variation,** *Nature,* July 30, 1987 328(6129), p.411-413, 14 refs.

This report covers the secular variation of daytime ClO in the lower stratosphere with a time resolution of 4 or 5 days, during the period Sep. 1 to Oct. 16. It is shown that the ClO concentration declines during the latter half of Sep. and disappears by early Oct. As ClO is directly involved in a catalytic ozone destruction cycle, these observations give evidence that the antarctic ozone hole is caused by a chemical depletion mechanism which operates in the early spring. This is also consistent with models in which large quantities of ClO are maintained through chemical reactions on the surface of polar stratospheric cloud particles which evaporate with the warming of the stratosphere. (Auth.)

Heusser, C.J., Rabassa, J., **Cold climatic episode of Younger Dryas age in Tierra del Fuego,** *Nature,* Aug. 13, 1987 328(6131), p.609-611, 36 refs.

Pronounced climatic change during the last glacial maximum is recognized as global in extent, and has been attributed to orbital forcing. Not readily explained in a global context because of the equivocal nature of the evidence are the late-glacial climatic events of short (100-1,000-yr) duration. The cold climate of the Younger Dryas chron (11,000-10,000 yr BP), for example, is known to have been particularly pronounced over the North Atlantic and parts of Europe and North America, whereas in the Southern Hemisphere,

cold conditions for that time are not well established. Evidence is presented for late-glacial climatic cooling in southernmost South America from studies of radiocarbon-dated glacial and pollen stratigraphy at sites along the Beagle Channel in Tierra del Fuego, where a forest-tundra tension zone in the region is especially sensitive to shifting climate. It is concluded that the cold episode corresponds with the time of the Younger Dryas in Europe. The influence of an extension of late-glacial sea ice surrounding Antarctica upon temperatures of the Fuegian archipelago is considered. (Auth. mod.)

Oppenheimer, M., **Stratospheric sulphate production and the photochemistry of the antarctic circumpolar vortex,** *Nature,* Aug. 20, 1987 328(6132), p.702-704, 27 refs.

Recent measurements of enhanced ozone depletion in springtime in the antarctic circumpolar vortex were accompanied by observations of unusual behavior of stratospheric aerosol. Enhanced concentrations of condensation nuclei (CN) were observed above 20 km. Some photochemical models predict elevated hydroxyl radical (OH) concentrations in the vortex. It is pointed out that high OH concentrations provide a sufficient source of CN through reaction with carbonyl sulphide (OCS) to account for the observed increase in CN mass. Other mechanisms for CN enhancement are inconsistent with timescales or the vertical structure inferred from aerosol observations. The CN enhancement provides partial support for photochemical models of ozone depletion in the vortex. (Auth.)

Darby, M.S., Mobbs, S.D., Brindley, J., **Energy cascades of Kelvin-Helmholtz instabilities in the stably stratified atmospheric boundary layer,** Advances in turbulence. Proceedings of the First European Turbulence Conference, edited by G. Comte-Bellot and J. Mathieu, Berlin, Springer, 1987, p.255-264, 3 refs.

DLC QA 911.E97 1986

A problem of fundamental importance in atmospheric boundary layer theory is that of the nonlinear evolution in space and time of an assemblage of waves. In the boundary layer, these waves occur under conditions of stable stratification, and may be thought of as internal waves, influenced to a greater or less extent by shear. The authors are concerned with an analysis of data obtaiend from the very strongly stratified atmospheric boundary layer which can develop in the antarctic winter night, where several months of darkness allow observations to be made in the absence of the complicating diurnal cycle. Their objectives are twofold; first, to identify the mechanisms by which the observed waves are generated, and secondly, to discover how the energy associated with these mechanisms is redistributed in the domains of wave-number and frequency. (Auth.)

Sievers, M.F., Weidner, G.A., Stearns, C.R., **Antarctic automatic weather station data for the calendar year 1986,** Madison, University of Wisconsin, 1987, 268p.

The automatic weather station (AWS) networks provide surface weather observations for specific meteorological experiments on the antarctic continent. At three-hourly intervals the AWS measures air temperature, wind speed and direction at nominal heights of 3 m, and air pressure at the electronics enclosure, usually at a height of 1.5 m above the surface. In addition, some AWS units measure the vertical air temperature difference between 3 and 0.5 m above the surface and relative humidity at 3 m above the surface. Heights above the surface are nominal since snow accumulates after installation. Data transmitted by the AWS are received and stored by the ARGOS data collection system on the NOAA series of polar orbiting satellites. ARGOS data are retransmitted by the satellite and are received and processed to scientific units by a local user terminal at McMurdo. Tables and figures give information about individual studies, their locations, and the principal investigators with affiliation. AWS data are presented as monthly summaries and as daily raw data readings. The report concludes with descriptions of instrument calibration procedures for each element measured and brief reports about each AWS. (Auth. mod.)

Monastersky, R., **Antarctic ozone reaches lowest levels,** *Science news,* Oct. 10, 1987 132(15), p.230.

A report is given on a six-week investigation of the ozone depletion over springtime Antarctica. Based at the southern tip of South America and utilizing two aircraft which flew into and under the areas of greatest ozone loss, a team of atmospheric scientists reported that ozone concentration had dropped to half its normal level. The consensus on the reason for the depletion is that it resulted from a combination of meteorological and chemical factors. Details of this view are outlined.

I-36353

Monastersky, R., **More clues to the mysterious ozone hole,** *Science news,* Sep. 19, 1987 132(12), p.182.

A review is given of preliminary results from the first National Ozone Expedition (NOZE 1) at McMurdo in Sep. and Oct. 1986. Possible interpretations of the data are presented but the evidence is not conclusive as to the primary cause of the springtime ozone depletion over Antarctica. The Expedition leader tended to support the chemical explanation for the depletion but emphasized the lack of conclusiveness of the data.

I-36354

Kerr, R.A., **Winds, pollutants drive ozone hole,** *Science,* Oct. 9, 1987 238(4824), p.156-158.

This report deals with observations made during the Airborne Antarctic Ozone Experiment when two aircraft flying from Punta Arenas, Chile, measured the low stratospheric springtime ozone layer over Antarctica. In Aug. and Sep. the two planes flew more than 175,000 km to gather data on the ozone depletion phenomenon. Results of the measurements could not be explained exclusively by either chemical or meteorological factors. Inconsistencies in measurements or sudden changes in ozone concentrations led researchers to conclude that antarctic winter/spring weather conditions enhanced the activity of chlorofluorocarbons which destroy ozone, and changes in the upper atmospheric circulation decreased ozone transport to Antarctica. Exclusivity of either chemistry or meteorology as the sole factor in these depletion events seems to have been ruled out.

Cacho Gomez, J., Gil Ojeda, M., Sainz de Aja, M.J., **Ozone hole. Ultraviolet radiation and ozone measurements during the Spanish scientific expedition to Antarctica, 1986-1987** [El agujero de ozono. Medidas de radiación ultravioleta y ozono durante la expedición científica española a la Antártida, 86-87], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.125-136, 17 refs., In Spanish with English summary.

As a contribution to the study of ozone distribution in the antarctic stratosphere, a number of total ozone and ultraviolet observations were carried out in summer 86/87 between 60-63 S. A brief review of the current knowledge of the 'ozone hole' phenomenon is presented. In conclusion, no anomaly is found regarding a decrease of total ozone, and the spring destruction phenomenon did not occur in the

latitudes observed. The high ultraviolet-radiation values are attributed to the composition of the lower stratosphere layers and not to a decrease in the effectiveness of the ozone cover filter. (Auth. mod.)

I-36368

Gil Ojeda, M., Cacho Gomez, J., Sainz de Aja, M.J., **UV-B radiation increment in Antarctica as a consequence of stratospheric ozone depletion** [Incremento de la radiación UV-B en la Antártida como consecuencia de la reducción del ozono estratosférico], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.137-148, 10 refs., In Spanish with English summary.

An ultraviolet radiation increase in the lower levels of the atmosphere may be the immediate result of ozone depletion. A simple model between mesopause and surface has been used to evaluate the increase rate under different situations. The study has been extended to antarctic latitudes and dates in which the phenomenon known as "ozone hole" is maximum. In the spring of 1985 and 1986 the ozone depletion corresponded to 60% of the normal values. (Auth. mod.)

Cisneros, J.M., **Relationship between aircraft contamination and the destruction of atmospheric ozone** [Relaciones entre la contaminación de los aviones y la destrucción del ozono atmosférico], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.149-160, 8 refs., In Spanish with English summary.

Many studies were carried out in the early 70's, when the first commercial flights reached the stratosphere at supersonic speeds, in an effort to estimate the effects of those flights on ozone contents of the atmosphere. Some of these studies were not restricted to the stratospheric level flights, but also considered the rising pollution in the rest of the conventional flight levels as a result of an increase in the density of military and commercial flight networks. The conclusions of these studies are discussed in this paper in the light of recent theories trying to explain ozone neutralization in the antarctic region. (Auth.)

Steele, L.P., **Global distribution of methane in the troposphere,** *Journal of atmospheric chemistry,* June 1987 5(2), p.125-171, Refs. p.169-171.

Methane has been measured in air samples collected at approximately weekly intervals at 23 globally distributed sites in the NOAA/GMCC cooperative flask sampling network. Sites range in latitude from 90S to 76N. The latitudinal distribution of methane and the seasonal variation of this distribution in the marine boundary layer has been defined in great detail, including a remarkable uniformity in background levels of methane in the Southern Hemisphere. The observation of a complete seasonal cycle of methane at the South Pole is reported. Globally averaged background concentrations in the marine boundary layer have been calculated for the 2 year-period May 1983-Apr. 1985 inclusive, from which an average increase of 12.8 ppb per year is found, or 0.78% per year when referenced to the globally averaged concentration (1625 ppb) at the mid-point of this period. Evidence is presented that there has been a slowing down in the methane growth rate. (Auth. mod.)

Eckman, R.S., Haigh, J.D., Pyle, J.A., **Important uncertainty in coupled chlorine-carbon dioxide studies of atmospheric ozone modification,** *Nature,* Oct. 15, 1987 329(6140), p.616-619, 14 refs.

Calculations are presented using a two-dimensional atmospheric model of the effect on stratospheric ozone of increases in the atmospheric abundances of CO2 and various chlorine-containing compounds. Such calculations have been carried out previously but changes in the kinetic data used in the model have led to very significant differences in the calculated ozone modification. In particular, the lower stratosphere, a difficult region to model, now plays an even more crucial role in the vertically integrated ozone depletion. It is believed that uncertainties in the thermal response of the lower stratosphere represent a significant limitation in our ability to predict future states of the middle atmosphere. The model extends from the ground to 95 km and from pole to pole. The figures presented show some of the antarctic and sub-antarctic data used.

Tuncel, G., Zoller, W.H., **Atmospheric iridium at the South Pole as a measure of the meteoritic component,** *Nature,* Oct. 22, 1987 329(6141), p.703-705, 33 refs.

The measurement of iridium (Ir) in atmospheric samples is important because it given information on the short-term flux of extraterrestrial material without interference from fragmentation products from large bodies. Such information cannot be obtained from sediment samples, because sediment samples integrate over millions of years and include contributions of large bodies impacted in that time period. Presented here is a determination of average particle-borne Ir concentration in the South Pole atmosphere. The average value of 7.3 x 10 sup -17 g/cu m suggests that the concentration of extraterrestrial material in the South Pole atmosphere is not large enough to explain the enrichments of anomalously enriched elements; however, meteoritic material contributes significantly to the observed concentrations of Co, Fe and Mn. The accretion rate for background extraterrestrial material is estimated at 11,000 tons annually. (Auth.)

Trenberth, K.E., **Role of eddies in maintaining the westerlies in the Southern Hemisphere winter,** *Journal of the atmospheric sciences,* June 1, 1987 44(11), p.1498-1508, 26 refs.

The distribution of the mean westerly wind over the globe is described for June, July and August, the southern winter, using analyses from the European Centre for Medium Range Weather Forecasts (ECMWF) from 1979 to 1982. The tropospheric momentum budget is analyzed from both the traditional Eulerian and the transformed Eulerian perspectives. Thus an assessment is made of the Eliassen-Palm flux divergence and the diabatically driven residual mean circulation. The vertical mean budget is also analyzed to allow deductions about the mean surface torque by the atmosphere on the earth and the gross surface stress. Analyses of parameters measured are shown in the various figures which extend through the sub-antarctic regions to the Antarctic. (Auth. mod.)

Melgarejo, J.W., **Analytical model of the boundary layer above sloping terrain with an application to observations in Antarctica,** *SMHI reports meteorology and climatology,* May 1986 No.51, 98p., Refs. p.72-75.

Analytical solutions of a set of equations that couples the Ekman and the Prandtl boundary layer equations were obtained; closure on the subgrid scale was via the eddy exchange (K) approach, where K was made to depend on both the internal stability and height raised to an arbitrary power. The boundary layer height was also made to depend on the internal stability. An interesting and novel result is

the finding that there are 3 different regimes of solutions, presented in graphical form, from which the appreciable influence of terrain slope on the cross-isobaric inflow angle, the momentum- and heat-transfer is clearly discernible. Also in a preliminary test of the results of this investigation with observations, it is found that the theoretical values of the cross-isobaric angle are in good agreement with the observed values in Antarctica and therefore encouraging for further research. Koptev, A.P., Zachek, A.S., **Results of methodology investigations by evaluation of subsystems for meteorological and actinometric observations** [Nekotorye rezul'taty metodicheskikh issledovaniĭ po otsenke podsistemy meteorologicheskikh i aktinometricheskikh nabliudeniĭ], *Leningrad. Arkticheskiĭ i antarkticheskiĭ nauchno-issledovatel'skiĭ institut. Trudy,* 1986 Vol.403, p.34-46, In Russian. 5 refs.

On the basis of statistical analysis of synchronized comparative measurements of air temperature and humidity, wind speed and direction and the computation of radiation balance, an assessment is made of the uniformity and isotropy of the meteorological and actinometric elements measured. Results confirm the reliability of the automatic systems evaluated.

I-36430
Koptev, A.P., Gil'chenko, N.G., **Characteristics of a semiautomatic method for actinometric measurements** [Osobennosti poluavtomaticheskogo metoda aktinometricheskikh izmereniĭ], *Leningrad. Arkticheskiĭ i antarkticheskiĭ nauchno-issledovatel'skiĭ institut. Trudy,* 1986 Vol.403, p.47-51, In Russian. 7 refs.

The following principal features of a method for the computation of radiation balance are described: measurement techniques, parameters measured, and equipment; auxiliary systems; accuracy; and the influencing physical factors, such as air temperature, humidity, wind speed and magnetic field intensity. In conclusion, analysis of literature reveals a 2-20% inaccuracy from instruments employed in the method discussed.

I-36431
Alekseeva, R.P., Gil'chenko, N.G., **Duration of sunshine measured by actinograph** [Opyt izmereniia prodolzhitel'nosti solnechnogo siianiia s pomoshch'iu aktinografa], *Leningrad. Arkticheskiĭ i antarkticheskiĭ nauchno-issledovatel'skiĭ institut. Trudy,* 1986 Vol.403, p.61-65, In Russian. 8 refs.

A method is proposed which should allow to fully automate the measuring process of sunshine duration and to obtain the measurements with a single threshold of the instrument's reaction. Presented are also monthly and yearly corrections for the values of sunshine duration obtained by heliographic and actinographic methods.

I-36432
Gil'chenko, N.G., Liachnev, V.V., **Instrument control method in computing radiation balance based on the law of probability** [Sposob kontrolia raboty ustanovok dlia izmereniia sostavliaiushchikh radiatsionnogo balansa, osnovannyĭ na ispol'zovanii veroiatnostnykh kriteriev], *Leningrad. Arkticheskiĭ i antarkticheskiĭ nauchno-issledovatel'skiĭ institut. Trudy,* 1986 Vol.403, p.66-73, In Russian. 16 refs.

A method is described for controlling the instruments for radiation balance computation based on the following criteria: probability of undetected error and probability of false error. Coefficients of allowable corrections for different values, or allowable error limits of model and equipment used, are determined. The method proposed permits to decrease significantly the length and labor of the operation; it brings about the control with very small probability of undetected error, and establishes a basis for marginal probability criteria of the measuring devices.

Beatty, N.B., ed, Workshop on First Detection of Carbon Dioxide Effects, Harpers Ferry, WV, June 8-10, 1981, **Carbon dioxide effects research and assessment program,** Washington, D.C., U.S. Dept. of Energy, Office of Energy Research, 1981, 546p., DE82-016 633, DOE/CONF-8106214, For selected papers see 42-838 through 42-843 or F-36498, F-36499 and I-36497.

Scientists are agreed that the global mean carbon dioxide concentration in the atmosphere is increasing at the rate of about 1.0 to 1.5 parts per million per year. In order to develop a program on the first detection of the effects of increased CO2 concentration, the best available scientists were engaged to point the way. To accomplish this, a Workshop sponsored by the U.S. Department of Energy was held at the Cliffside Motor Inn, Harpers Ferry, West Virginia, June 8-10, 1981. Four areas were examined: the atmosphere, the polar regions, the oceans, and the biosphere. Papers were commissioned for presentation in each of these areas, and other relevant papers were also included. In addition, four panels were set up, one in each of these areas, to discuss the papers and other relevant material. All the papers and the panel reports are included in this volume. Three are pertinent to Antarctica.

I-36497

Fletcher, J.O., Boville, B.W., **Report on the Polar Panel,** Workshop on First Detection of Carbon Dioxide Effects, Harpers Ferry, WV, June 8-10, 1981. Proceedings. Carbon dioxide effects research and assessment program. Edited by N.B. Beatty, Washington, D.C., U.S. Dept. of Energy, Office of Energy Research, 1981, p.197-205. DOE/CONF-8106214; DE82-016 633.

Discussions of detection of CO2 effects in the polar regions are presented in 3 phases: monitoring of CO2 concentrations—in particular the seasonal variation comparisons between the Arctic and the Antarctic, radiative effects of changing CO2, and early indicators of climatic variation. Descriptions of each phase, with a list of recommendations for effective control measures, are offered.

Nomura, A., **Lidar observations of the mesospheric sodium layer at Syowa Station, Antarctica,** *Geophysical research letters,* July 1987 14(7), p.700-703, 16 refs.

The mesospheric sodium layer was measured for 42 nights during the period from Apr. to Oct., 1985, at Showa Station by using a dye laser radar (lidar) tuned to the D2 line of sodium. In contrast to the results obtained at mid-latitudes in the Northern Hemisphere, the seasonal variation in abundance showed no significant winter maximum. Further, there was no apparent seasonal variation in the vertical distribution of sodium density. However, oscillatory variations in abundance with a period of about 40 days was observed. The nocturnal variations in the sodium density profile have a wavelike structure with a vertical wavelength of 10 to 16 km and a period of 3 to 8 hours, which suggests strongly that gravity waves are propagating upward through the sodium layer. The sodium lidar measurements during auroral activity give evidence that the layer is disturbed in association with the auroral breakup event. (Auth.)

Webster, C.R., **NO2/NO partitioning as a test of stratospheric ClO concentrations over Antarctica,** *Geophysical research letters,* July 1987 14(7), p.704-706, 12 refs.

Physical conditions in the 10-20 km region of the antarctic stratosphere make the $[NO_2]/[NO]$ ratio particularly sensitive to high chlorine levels in the form of ClO. According to simple known photochemical relationships between NO2, NO, ClO, and O3, high ClO levels of 1 ppbv over Antarctica must be accompanied by large values of the $[NO_2]/[NO]$ ratio. At high ClO abundances, the $[NO_2]/[NO]$ ratio is approximately proportional to the ClO concentration. It is proposed that *in-situ* measurements of the $[NO_2]/[NO]$ ratio could be used to test the high chlorine hypothesis. (Auth.)

Garcia, R.B., Solomon, S., **Possible relationship between interannual variability in antarctic ozone and the quasi-biennial oscillation,** *Geophysical research letters,* Aug. 1987 14(8), p.848-851, 26 refs.

Extra-tropical temperatures, geopotential heights, and total ozone abundances are known to vary with the tropical Quasi-Biennial Oscillation (QBO), although the details of the causal mechanisms linking the two regions are still a subject of debate. It is shown that total ozone amounts observed in Antarctica during 1979-1986 exhibit year-to-year fluctuations that may be due to the influence of the QBO, with relatively low (high) values occurring during the westerly (easterly) phase. This suggests that the QBO should be taken into account when evaluating the amplitude and continuation of the long-term trend in antarctic total ozone. In particular, if the tropical QBO is in its westerly phase during Oct., 1987, an increase in total ozone at that time may be inconsistent with the continuation of the secular decrease observed since the 1970's. (Auth.)

I-36510

Sabutis, J.L., Stanford, J.L., Bowman, K.P., **Evidence for 35-50 day low frequency oscillations in total ozone mapping spectrometer data,** *Geophysical research letters,* Sep. 1987 14(9), p.945-947, 14 refs.

A large number of investigations is currently focused on low frequency oscillations (LFO) of the tropical atmosphere, with periods of one to two months. Recently, the existence of LFO in the stratosphere has been postulated by global circulation model results and also by observations based on satellite microwave and infrared data. However, the observational results are not well captured by the model calculations. The present work utilizes an independent set of satellite data, four years of data from the Total Ozone Mapping Spectrometer

(TOMS), between latitudes 65N and 65S, as a check on the previous observational analyses. Evidence is found for the existence of 35-50 day oscillations in the TOMS data over the Southeast Pacific and South Indian oceans, corroborating the earlier observational report. (Auth.)

I-36522

New Zealand. Department of Scientific and Industrial Research. Antarctic Division, **Antarctic weather,** Christchurch, n.d., 6 leaves.

A brief overview is given to acquaint newcomers with a part of the natural environment they will have to cope with. Temperatures and winds are discussed and a table shows monthly averages at Scott Base and McMurdo. Weather phenomena are linked to wind directions, katabatic wind effects are pointed out, and some of the unique polar atmospheric features, such as whiteouts and long sunlight periods, are noted.

I-36541

Nogués-Paegle, J., Stucki, S.C., **Impact of winds over the antarctic plateau on Southern Hemisphere circulations,** Conference on Mountain Meteorology, 4th, Seattle, WA, Aug. 25-28, 1987. [Proceedings], Boston, MA, American Meteorological Society, 1987, p.238-240, 3 refs.

After a review of ice cover and solar radiation interaction, and the resulting formation of katabatic winds, a study of the wintertime characteristics of atmospheric flows over Antarctica, based on 6 yr. gridded data obtained from the European Center for Medium Range Weather Forecasts, is reported. Results are compared with those obtained from a linearized shallow water equation model. Differences between these solutions and winter averaged flows suggest a classification method to isolate persistent circulations over mid and high latitudes of the Southern Hemisphere.

Jones, R.R., **Ozone depletion and cancer risk,** *Lancet,* Aug. 22, 1987 2(8556), p.443-447, 34 refs.

The sharp decline in ozone concentrations over Antarctica, and the vast implications for human health that any extension of this depletion to more densely populated areas of the globe will carry, are discussed. From this point of view, the ozone chemistry, absorption of ultraviolet radiation by ozone in the stratosphere and the biological consequences to living organisms when this fails, are reviewed, the etiology of skin cancer being linked to ultraviolet exposure. It is pointed out that only an 85% reduction in CFC output would stabilize atmospheric ozone concentration at the present level. So far the EEC countries have committed themselves only to a freeze, to be followed by a 20% reduction after 5 years.

Kikuchi, T., Ageta, Y., **Glaciological research program in east Queen Maud Land, East Antarctica, Part 6, Advance Camp, 1985,** *Japanese Antarctic Research Expedition. JARE data reports,* Sep. 1987 No.129, 104p., 4 refs.

The inland traverse party of JARE-26 reached the Advance Camp (AC), established as part of the East Queen Maud Land Glaciological Project, on Feb. 7, 1985, where glaciological and meteorological observations were carried out until the end of the month. The party left AC on Mar. 1 for wintering over at Mizuho and Showa stations, returning to AC on Oct. 14, 1985. Ice cores were drilled to a depth of 200 m. The report provides the following glaciological and meteorological data obtained at AC: the surface and the upper atmosphere meteorological data, the net radiative heat flux, and the net accumulation of snow.

Yoshihira, T., Shudo, Y., Kajihara, R., Sasaki, M., **Meteorological observations at Syowa Station in 1982 by the 23rd Japanese Antarctic Research Expedition,** *Antarctic record,* July 1987 31(2), p.131-154, In Japanese with English summary. 8 refs.

This paper describes the results of meteorological observations from Feb. 1, 1982 to Jan. 31, 1983, at Showa Station. The observations and the statistics of surface and aerological data were automatically processed until Sep. 1, 1982 after which the upper air observations were carried out manually. Remarkable characteristics are as follows: the ten-day mean temperature of late Aug. and early Sep. was lower than the normal values over 5 C. A minimum temperature -45.3 C, recorded on Sep. 4, was the lowest value since the observation had begun at Showa Station. Forty-two blizzards occurred of several days duration. The snow depth measured on Oct. 30 was 105.6 cm, which was deeper than the normal values throughout the year. (Auth.)

Stolarski, R.S., **Antarctic ozone hole,** *Scientific American,* Jan. 1988 258(1), p.30-36, 3 refs. (p.112).

A review is given of the recent findings of ozone depletion over the South Pole region and the role of chlorofluorocarbons (CFCs) as a cause of the depletion. Chemical processes are described to show how the CFCs react on ozone to attenuate the shield over Antarctica. Some of the effects of the depletion on people and environments are discussed. A possible role is projected of polar stratospheric clouds as transformers of chlorine reservoirs into active chlorine to react unfavorably with the ozone as the sun begins to shine again following the dark antarctic winter. A dynamical mechanism as a factor in the process is also a possibility.

Krueger, A.J., Stolarski, R.S., Schoeberl, M.R., **Characteristics of the antarctic ozone hole derived from Nimbus 7 TOMS data,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.1-9, 15 refs.

The general structure of Southern Hemisphere total ozone is a polar minimum surrounded by a circumpolar maximum. Over much of the year the gradients are quite small except for local midlatitude storms. However, during the spring months the difference between the minimum and the maximum grows with time. The boundary of the polar minimum is generally very sharp with a gradient of 10 Dobson units/100 km not uncommon, thus justifying the term "ozone hole" to describe this feature. A station in the boundary region will undergo very large changes in ozone as the position of the hole drifts and fluctuates. Finally, the ozone hole is destroyed as the polar vortex breaks down in Nov. The data from TOMS show that dynamics are critical in the formation of the ozone hole. Total ozone in the antarctic region is highly correlated with air temperature in the lower stratosphere. (Auth. mod.)

Kondoh, K., Iwasaka, Y., Suzuki, T., Kaneto, S., **Ozonesonde measurements at Syowa Station (69 deg 00 min S, 39 deg 35 min E): preliminary result,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.10-17, 15 refs.

Ozonesonde measurements at Showa Station from 1971 to 1984 show that ozone depletion was most striking at altitudes between 10 to 25 km for the spring of the last 5 years. This ozone loss region corresponds to the region where a noticeable temperature drop was observed, also only in the spring, from 1981 to 1985. The comparison of the change in temperature field of the antarctic stratosphere with that in the other regions suggests the possibility that the changes with a long time scale of about 10 years in the global-scale temperature field (and possibly with the dynamical systems in the stratosphere) are associated with the antarctic ozone depletion in the last 10 years or so. (Auth.)

Sekiguchi, Y., **Antarctic ozone change correlated to the stratospheric temperature field and the solar activity,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.18-23, 9 refs.

Total ozone data obtained by ground-based measurements using a Dobson spectrophotometer at Showa Station are analyzed together with stratospheric temperature data at the same site. The period of analysis is 21 years from 1966 to 1986, covering almost two solar cycles. The time series of monthly averages of the two quantities for Oct., Nov. and Dec. is compared with the time series of the relative sunspot numbers. A moderately high correlation is found between the relative sunspot number, and the total ozone and the stratospheric temperature at Showa for the 21-year period. A peak negative correlation with respect to the present-day 11-year sunspot cycle is found at a lag of 3 years of ozone (or temperature) relative to the sunspots. This result is discussed in connection with the results obtained by other observers in 1962 and 1965. (Auth.)

Iwasaka, Y., Shi, G.-Y., **Comment on aerosol effect on antarctic ozone,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.24-30, 21 refs.

The structure of the aerosol layer disturbed by cold air was suggested from lidar measurements at Showa Station. A particle layer containing sublayers of spherical or nonspherical aerosols is frequently observed in the antarctic spring. It is a point one should not ignore when discussing aerosol effects on antarctic ozone depletion through radiative processes and heterogeneous chemical reactions. (Auth.)

Kawahira, K., Hirooka, T., **Interannual variations of zonal mean temperature in the Southern Hemisphere stratosphere: with reference to the antarctic ozone depletion,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.31-38, 11 refs.

Interannual variations of the zonal mean temperature in the antarctic lower stratosphere are analyzed for the period 1980 to 1985 by using NMC data. It is found that the antarctic polar stratosphere tends to cool not only in spring but in all seasons. Analysis of the meridional gradient of the zonal mean temperature shows that the period of temperature decrease toward the pole in winter has become longer and longer in recent years in accord with the antarctic ozone depletion. From this evidence, the interrelation between the temperature decline and the ozone depletion is considered as follows: slight cooling induced by the effect of increasing CO2 can form polar stratospheric clouds, and more clouds are formed by radiative cooling. Enhanced cooling in the polar region can induce ozone depletion due to less poleward transport of ozone by planetary waves, which becomes less active in the polar region due to trapping by long-persistent, strong westerlies. (Auth.)

I-36596
Yamazaki, K., **Transport characteristics in the troposphere and lower stratosphere of the Southern Hemisphere,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.39-53, 19 refs.

Trajectory analyses of air parcels for the Southern Hemisphere spring are performed with observed data during the period from Sep. to Dec. 1982. It is found that the diffusivity at 60S and poleward in the lower stratosphere is low during early spring. Diffusion in Dec. is nearly homogeneous and turbulent in the lower stratosphere. Net advective motion is estimated. In Sep. at 50-100 mb, the net advective motion is upward in the polar region and downward at 50-60S. This meridional cell is quite similar to one proposed earlier in both shape and magnitude. A sudden increase of ozone was observed at Showa Station on Oct. 28, 1982. It is inferred from the backward trajectory analysis that this sudden ozone increase was primarily caused by a strong downward motion. (Auth.)

Tanaka, H., **How gravity waves affect formation of low temperature region in antarctic lower stratosphere,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.54-58, 5 refs.

A mechanism is proposed for the formation of an "ozone hole" over Antarctica. Gravity waves emitted from the circum-continental

mountain (or cliff) belt may be partly saturated in the lower stratosphere and suppress planetary wave activity there. This process results in shielding a poleward heat transport associated with planetary waves. A long-term trend of gravity wave activity and prevailing wind system for the past several years should be detected in the polar region. (Auth.)

I-36599

Hirota, M., Murayama, H., Makino, Y., Muramatsu, H., **Gas-chromatographic measurements of atmospheric methane at Syowa Station in 1983, and between Tokyo and Syowa Station late in 1984,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.69-73, 6 refs.

Atmospheric methane was measured by a gas-chromatographic method. Air samples were collected at Showa Station in 1983, and on board between Tokyo and Showa Station late in 1984. Mixing ratios at Showa Station showed some seasonal variation and were in good agreement with those at Mawson Station. Mixing ratio decreased gradually from 30 to 5N, and steeply between 5N and the equator. In the Southern Hemisphere, mixing ratios were almost constant between the equator and 66S. The mean value was 1.577 ppm and the standard deviation was 0.008 ppm. (Auth.)

Yamato, M., **Evidence for the presence of submicron sulfuric acid particles in summer antarctic atmosphere: preliminary results,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.74-81, 11 refs.

Direct samplings of aerosol particles in the summer antarctic atmosphere were carried out at Showa Station and Asuka Camp (71.5S, 24.1E) in 1985 and 1986. To determine the molecular state of submicron sulfate particles, a vapor-deposited calcium thin film method was used. It was proved directly that sulfuric acid particles predominated at Showa Station and Asuka Camp in the summer antarctic atmosphere. (Auth.)

I-36601

Yamato, M., Iwasaka, Y., Ono, A., Yoshida, M., **On the sulfate particles in the submicron size range collected at Mizuho Station and in east Queen Maud Land, Antarctica: preliminary results,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.82-90, 13 refs.

Aerosol particles were sampled at Mizuho Station and in east Queen Maud Land (73.1-74.8S, 39.8-34.8E) from Apr. to Nov. 1984. The vapor-deposited BaCl2 thin film method was used to identify sulfate-containing particles. Morphological identification of the individual particles was also made in order to determine their actual molecular state. It was confirmed from the morphology of particles that particles containing sulfuric acid were predominant in east Queen Maud Land in summer, whereas ammonium sulfate particles were predominant in winter at Mizuho Station. These results are similar to the results at Showa Station. Sulfuric acid particles existed as a minor component at Mizuho Station even in winter when photochemical production of sulfuric acid particles was not dominant. (Auth.)

Endoh, T., **Trial operation of a simple automatic weather station at Asuka Camp, Antarctica,** NIPR Symposium on Polar Meteorology and Glaciology, 9th, Vol.1 edited by T. Matsuda, S. Kawaguchi, and O. Watanabe, Tokyo, National Institute of Polar Research, 1987, p.103-112, 1 ref.

A tentative unmanned observation program was carried out at Asuka Camp in 1985 by means of a data logger equipped with a thermometer and an anemometer. The data logger, run by lithium batteries, was buried in the surface snow without any heater. Although the sensors were covered by heavily drifting snow during the later period of observation, the desired recordings were performed successfully. Analyses of the obtained data provided information on diurnal variations of air temperature, periods and behavior of disturbances, monthly mean air temperature and depth of snow drift at Asuka Camp in 1985. (Auth.)

Hofmann, D.J., Rosen, J.M., Harder, J.W., Rolf, S.R., **Observations of the decay of the El Chichón stratospheric aerosol cloud in Antarctica,** *Geophysical research letters,* June 1987 14(6), p.614-617, 14 refs.

Balloonborne measurements of stratospheric aerosol in the late Oct.-early Nov. period in 1983, 1984 and 1985 indicate that the sulfuric acid aerosol which formed in the stratosphere following the eruption of El Chichón in 1982, and which was subsequently transported to the polar regions, decayed over Antarctica with an exponential decay time of about one year, in reasonable agreement with extensive measurements at Laramie during this period. These results suggest that the increased aerosol burden over Antarctica, which occurred as a result of the El Chichón eruption, cannot be directly involved in the precipitous decline of stratospheric ozone in Antarctica since 1982, although indirect effects cannot be ruled out.

Goldman, A., Murcray, F.J., Murcray, F.H., Murcray, D.G., **Quantification of HCl from high resolution infrared solar spectra obtained at the South Pole in December 1986,** *Geophysical research letters,* June 1987 14(6), p.622-623, 6 refs.

Ground-based infrared solar spectra at 0.02/cm resolution obtained at the Amundsen-Scott South Pole station in Dec. 1986 have been analyzed for the atmospheric content of HCl. Nonlinear least-squares spectral fitting applied to the spectra yields a total HCl column amount of 6.4 quadrillion molec/sq cm, most being stratospheric. This amount is larger than that extrapolated from earlier results on the latitudinal distribution of atmospheric HCl. (Auth.)

Connor, B.J., **Ozone over McMurdo Station, Antarctica, austral spring 1986: altitude profiles for the middle and upper stratosphere,** *Journal of geophysical research,* Nov. 20, 1987 92(D11), p.13,221-13,230, 39 refs.

Various ozone altitude profiles were measured from McMurdo Station by ground-based millimeter-wave spectrometry, on 34 days between Sep. 12 and Oct. 29, 1986. The mixing ratio peaked at altitudes ranging from 28 to 34 km, with peak values between 5 and 9 parts per million by volume (ppmv). The ozone mixing ratio at 25 km decreased by 15% during the period. No significant decrease was observed at higher altitudes; the upper limit on any secular trend at 33 or 40 km is about 8%. Considerable variability was observed at all altitudes, on time scales of 1 to a few days. In the most dramatic case, ozone in one layer nearly doubled between Sep. 20 and 23. This was accompanied by a significant warming and an increase in N2O at the same altitudes. Results are compared to concurrent balloon-

sonde ozone measurements, to a model prediction, and to satellite measurements of total ozone. The observation that ozone depletion was confined to the lower stratosphere is consistent with theories invoking heterogeneous chemistry associated with polar stratospheric clouds. It may be consistent with theories which predict upwelling is confined to the lower stratosphere. The data do not support theories predicting depletion in the upper stratosphere, but the seasonal coverage of the measurements was too limited to be definitive. (Auth.)

Kotliakov, V.M., **Evolution of thermal conditions in Central Antarctica for the last 150,000 years determined from oxygen isotope studies of a core from Vostok Station** [Evoliutsiia termicheskikh uslovii Tsentral'noĭ Antarktidy za 150 tysiach let po izotopno-kislorodnym issledovaniiam kerna so stantsii Vostok], *Materialy gliatsiologicheskikh issledovaniĭ,* Jan. 1987 Vol.59, p.30-37, In Russian with English summary. 43 refs.

The ice core from Vostok Station, from the surface to a depth of 2081 m, agrees with isotope horizons 1-6 of oceanic sediments, with the age up to 150-160 thousand years. The data obtained for the central areas of East Antarctica testify to the conditions of glacial maximum during the isotope stages 2, 4, 5(d), 6; interstadials 3, 5(a-c) and interglacial 5(e) and variations of the mean annual temperature, respectively by -6, -8, -2, -5 and 3-4 deg, as compared to the present-day temperature. Comparison of these data with numerous data on oceanic sediments suggests the transition from the interglacial to the Last Ice Age in polar latitudes about 115,000 years ago, while in the temperate and low latitudes it took place only 75,000 years ago. (Auth.)

Verbitskiĭ, M.IA., Monin, A.S., Chalikov, D.V., **Modelling of Quaternary glaciations** [Modelirovanie chetvertichnykh oledeneniĭ], *Materialy gliatsiologicheskikh issledovaniĭ,* Jan. 1987 Vol.59, p.38-42, In Russian with English summary. 10 refs.

A thermohydrodynamic model of the system Glaciers-Ocean-Atmosphere-Astenosphere made it possible to analyze the causes of ice ages. Tests of the sensitivity of this model to the changes of initial conditions have shown that the Earth's climate is intransitive under the present-day conditions of insolation and position of the continents. Climatic system is established to have 5 steady states, associated with different spreading of the ice cover. Mechanisms governing the transition of one climate into another are analyzed. It is concluded that location, form, dimensions and relief of the continents are decisive agents of the global climatic changes. (Auth.)

Fukunishi, H., **MAP observations at Syowa Station in 1985,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.229-243, 24 refs.

Coordinated observations of the antarctic middle atmosphere were conducted by JARE-23 and JARE-26 at Showa Station during 1982-1985 in cooperation with the Middle Atmosphere Program (MAP). An outline of the campaign is given. Observations were carried out by a combination of remote-sensing techniques from the ground and spacecraft and *in-situ* measurements with balloons and sounding rockets. The major ground-based remote-sensing facilities were a Dobson spectrophotometer for ozone measurement, a ruby lidar for stratospheric aerosol measurement and a dye lidar for sodium layer measurement, a VHF doppler radar for measuring motions of ionized and neutral atmospheres and a multi-beam riometer for monitoring particle precipitation. The meteorological rockets launched at 2-hour intervals succeeded in detecting internal gravity waves at the 20-70 km altitude range. (Auth. mod.)

Gernandt, H., **Preliminary result of the ozone observation at GDR-Research Base (70.77S, 11.85E) from May to Dec. 1985,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.256-271, 3 refs.

At 70.77S, 11.85E, regular balloon-borne ozone soundings were started in 1985. These soundings have been performed using an electrochemical ozone sonde on the basis of the Brewer principle. A comparison was made with ozone soundings at middle northern latitudes. During polar spring, the period of extreme ozone depletion, a double peak structure was typical at 71S. The analysis of the height variations of two peaks suggests that they are due to different physical mechanisms at high southern and middle northern latitudes. (Auth.)

Trenberth, K.E., **Interannual variability of storm tracks and eddy activity in the Southern Hemisphere,** International Conference on Southern Hemisphere Meteorology, 1st. Proceedings, Boston, American Meteorological Society, 1983, p.1-6, Spanish version p.7-11. 21 refs.

The zonal mean of the Global Weather Experiment (GWE) statistics have been compared with the means and standard deviations over all years; a sampling of these results is presented here. However, for both summer and winter, years that show a marked contrast to that of the GWE are chosen in order to compare the dynamical consistency of the changes in the relationships between the mean flow and eddy statistics. The GWE summer of 1978-79 is contrasted with 1976-77 and, for winter, 1979 is contrasted with 1980. For summer as a whole, neither the mean fields nor the eddy statistics were extremely unusual. For winter, both the mean flow and the eddy statistics during the GWE were quite anomalous in many respects. (Auth.)

Mechoso, C.R., Hartmann, D.L., Yamazaki, K., **Observations of traveling planetary waves and of wave, mean-flow interactions in the Southern Hemisphere,** International Conference on Southern Hemisphere Meteorology, 1st. Proceedings, Boston, American Meteorological Society, 1983, p.29-32, 8 refs.

A persistently eastward propagating zonal wavenumber 2 accounts for a large fraction of the wave energy in the Southern Hemisphere stratosphere. The nature of transient waves in the Southern Hemisphere and their interaction with the mean flow is the subject of this paper. The data used in this study are for the winter period of May 14-Sep. 13, 1979. The power, phase and coherency for zonal wavenumber 1 moving eastward a band of periods centered on 15 days is shown. The power has two maxima at 300 mb, one at 50S and one at 70S. Similar results have been obtained for the eastward moving component of wavenumber 2. When the westward moving components of zonal wavenumbers 1 and 2 are considered, quite different results are obtained. There is only one coherence-squared maximum in the troposphere and the coherence between the troposphere and the stratosphere is substantial. (Auth.)

Renard, R.J., Thompson, W.J., Hervey, S.P., **Analysis of pressure, temperature and wind data from remote site automatic weather stations near McMurdo, Antarctica,** International Conference on Southern Hemisphere Meteorology, 1st. Proceedings, Boston, American Meteorological Society, 1983, p.234-237, 5 refs.

A remote site automatic weather station (AWS) network has been established on the antarctic continent and the nearby ice shelf areas. The network has grown from one AWS at several testsite locations in the period 1975-1977 to 13 currently. A map shows the general areas of antarctic deployment. Data from stations on the Antarctic Peninsula will be used for barrier wind studies and data from sites between Dumont d'Urville and Dome Charlie for katabatic wind research. AWS observations from the western Ross Ice Shelf area have been used to identify mesoscale circulations and give operational support to the McMurdo Weather Center. Data from all units will add to the climate base; in particular, the units at Byrd and Siple will contribute to long-term climate monitoring. (Auth.)

Lyons, S.W., **Characteristics of intense antarctic depressions near the Drake Passage.,** International Conference on Southern Hemisphere Meterology, 1st. Proceedings., Boston, American Meteorological Society, 1983, p.238-240, 4 refs.

Composites of polar depression characteristics from NOAA-7 photographs have resulted in a model to aid in subjective classification of polar depression strength. Polar depression composites have identified 5 primary features associated with depression intensity. Listed in order of importance, and discussed, they are: direction of depression movement, cloud and frontal deformation with time, extent of cloud vortex curvature, speed of depression, and cloud characteristics. A classic example of an antarctic depression formation and movement through the Drake Passage is shown. (Auth. mod.)

Carleton, A.M., **Interannual variations in Southern Hemisphere sea ice-cyclone interactions,** International Conference on Southern Hemisphere Meterology, 1st. Proceedings., Boston, American Meteorological Society, 1983, p.241-244, 11 refs.

The author examines the link between interannual variations in the latitudinal extent of southern ocean sea ice and the synoptic-scale (cyclonic) atmospheric circulation of the Southern Hemisphere during the five winter-growth periods (June through Sep.) of 1973-77. Strong variations characterize both parameters for this period. The study also verifies the strongly regional dependence of ice-cyclone interactions in the circumpolar trough. These appear strongest in the Ross Sea, but are still of importance in East Antarctica. Cyclonic activity is secondary to ice distribution and its interannual variability in the Weddell Sea. (Auth.)

International Conference on Southern Hemisphere Meteorology, 2nd, Wellington, New Zealand, Dec. 1986, **Proceedings,** Boston, American Meteorological Society, 1986, 482p., For individual papers see 42-1388 through 42-1396 or F-36671, I-36660 through I-36670 and I-36672 through I-36678.

The Conference, which was held in Dec. 1986 in Wellington, New Zealand, received responses from scientists in 17 different countries. They submitted more than 150 papers of which 120, in extended abstract form, are included in this volume along with short abstracts of 12 others. Weather analysis and forecasting is one highlighted topic; a new emphasis on Tropical Oceans Global Atmosphere (TOGA) is also strongly featured with sessions on El Nino-Southern Oscillation and tropical meteorology. Twenty of the papers have significant application to Antarctica. These discuss, among others, such topics as sea ice, simulation of antarctic climate, katabatic and upper level winds, automatic weather stations, the meteorology of besetment, laser cloud studies, and atmospheric ozone.

Budd, W.F., **Southern Hemisphere circulation of atmosphere ocean and sea ice,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.101-106, 16 refs.

A major feature of the Southern Hemisphere atmospheric circulation is the strong concentration of centers of low pressure systems in the region from 40 to 70S around the edge of the antarctic continent and sea ice zone. Results of a 5 year study of the mean climatology of cyclogenesis in the Southern Hemisphere were reported earlier. This study has since been extended to each month of a 10 year period. This extended data set now provides a basis for describing the mean climatology of the annual cycle of cyclogenesis, cyclone tracks and cyclolysis as well as the interannual variability. (Auth.)

Simmonds, I., Dix, M., **Circulation changes induced by the removal of antarctic sea ice in a July general circulation model,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.107-110, 8 refs.

While a number of general circulation model studies have been performed with high latitude forcing by prescribed sea ice and sea surface temperature anomalies in the Northern Hemisphere (NH) few have been carried out for the Southern Hemisphere (SH). There are several reasons for believing that the responses there could be rather different from those produced in the NH (SH sea ice is more zonally-symmetric, the circulation regime is very different, etc.). A large sea ice anomaly was imposed on a model of Sep. climate in the SH. In this paper experiments are reported which extend the work using an improved model. An assessment is made of the remote and local response of a model atmosphere to large- and regional scale sea ice forcing in the SH. (Auth.)

Stucki, S.C., Paegle, J.N., **Effect of Antarctica on upper level flows during the 1979 winter,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.113-116, 8 refs.

This study is based on data from the 92 days of June, July and Aug. 1979, during the Global Weather Experiment for which the most comprehensive data sets ever were collected. Gridded analyses developed at the Geophysical Fluid Dynamics Laboratory (GFDL) are used. Differences between the 1979 winter and the climatological mean may be due to either a better data base or to an anomalous year. The most significant changes were lower heights over Antarctica, a deep circumpolar pressure belt, and larger values of the high latitude zonal wind maxima. This strong circulation should facilitate detection of signals at the high latitudes emphasized in the investigation. (Auth.)

James, I.N., **Katabatic drainage flows over Antarctica and the polar vortex,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.117-118, 4 refs.

The spectacular and persistent katabatic winds over the antarctic continent have been studied by several authors and the strength and orientation of the surface wind relative to the orography of the ice sheet are now reasonably well understood. The persistent outflow of surface air from the continent must, in the long time mean, be balanced by inflow aloft. In turn, this general convergence in the middle troposphere will generate cyclonic vorticity over the continent. Three questions arise and are addressed: is the vorticity generated by this process comparable to that resulting via thermal wind balance from surface temperature contrasts between ice and ocean? What vertical structure and, in particular, what depth will the return circulation have? Can a relationship between the ice sheet topography and the upper level vorticity be outlined? (Auth.)

Van Meurs, B., Allison, I., **Application of automatic weather station data to the study of katabatic flow in East Antarctica,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.119-122, 8 refs.

Parameters measured by the automatic weather stations deployed by ANARE include air pressure, wind speed and direction 4 m above the surface, air temperatures at 1, 2 and 4 m above the surface, and snow temperature. One AWS operated continuously from Jan. 1982 to May 1984 at a site about 130 km inland from Mawson Station, at an elevation of 1850 m on the relatively steep edge of the ice sheet where katabatic flow is dominant. Two years of data from this station were analyzed to show the annual and diurnal variation of wind and temperature at this site and gain some insight into the inversion strength and the strength of the katabatic flow. The analysis carried out was based on the assumption of zero potential temperature gradient along the ice slope and the validity of this is discussed. The results are presented on a seasonal basis determined from additional data from a solar cell on the station which indicated that the year could be conveniently divided into 4 seasons on the basis of the duration and intensity of solar radiation. Savage, M.L., Stearns, C.R., **Weather and climate in the vicinity of Ross Island, Antarctica,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.123-126, 2 refs.

Remarkably persistent southerly surface winds occur over the northwestern Ross Ice Shelf. On the climatic scale, the persistent drainage of cold air from the antarctic interior to lower latitudes may generate sufficient baroclinity at the interface between the Ross Ice Shelf and the Transantarctic Mountains to produce mountain-parallel flow at the surface. This is the barrier wind explanation introduced in 1970. The analyses presented here support this theory, and indicate that even in the case of cyclones impinging upon the region, the influence of topography is sufficient to distort the low level circulations into prematurely initiating and sustaining strong southerly winds. Chubachi, S., Kajiwara, R., **Annual change of atmospheric ozone including the polar night season at Syowa Station, Antarctica,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.138-140, 2 refs.

The change of atmospheric ozone over Antarctica is interesting with respect to the decreasing tendency of total ozone over Antarctica called "OZONE HOLE" phenomenon. This phenomenon was first reported as an extraordinarily low value of total ozone from Sep. to Oct. in 1982 at Showa Station. In this paper, the corrected value of total ozone and the vertical ozone distribution are described. Because of the extended periods without sunlight over Antarctica, it is important to compare the accuracy of moonlight and sunlight observations. (Auth.)

Kidson, J.W., **Indices of the Southern Hemisphere zonal wind,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.188-191, 8 refs.

In a recent study, an examination was made of an irregular cycle which appeared during the winter months of 1979 with an average period of around 27 days. Opposing variations in the 500 hPa zonal wind were found in bands centered on 48.75 and 67.5 S and an index based on their difference was used to depict the changes in circulation patterns. A preliminary study based on Australian hemispheric analyses for 1968-1983 suggested that the zonal index variations were larger and more regular than usual during the winter of 1979. This presentation describes a more detailed analysis of the Australian data at both 500 hPa and mean sea level over this extended period and derives two principal indices which characterize variations in the zonal circulation. The behavior of these indices is examined on a seasonal basis and their relation to the hemispheric flow patterns explored. (Auth.)

Yamazaki, K., Tokioka, T., Kitoh, A., **Interannual variation and teleconnections in the Southern Hemisphere simulated by a 12-year run of the MRI GCM-I,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.204-207, 9 refs.

Teleconnectivity and EOF analysis are used to explore the dominant spatial pattern of the long-term variations in the Southern Hemisphere model atmosphere. Generally, the teleconnectivity in the Southern Hemisphere is weaker than that in the Northern Hemisphere in winter and summer. The teleconnectivity in summer is stronger than that in winter. There exists an out-of-phase relation between the middle latitude and the south polar region in the 300 mb geopotential height and the sea level pressure. This north-south seesaw simulated by the model is clearly seen in summer, and is similar to the observed one. (Auth.)

Mechoso, C.R., Farrara, J.D., **Climatology and interannual variability of wave, mean-flow interaction during winter and spring in the Southern Hemisphere,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.304-307, 14 refs.

Studies of the spring circulation in the Southern Hemisphere became particularly timely after the recent discovery of a pronounced trend towards ozone depletion particularly over Antarctica during this season. The spatially and temporally localized character of this feature in ozone depletion suggests that dynamical processes play a major role in its development. Sections 2 and 3 of this paper describe the winter and spring circulations and their interannual variability, respectively. The circulation during winter and spring of 1982 is analyzed in Section 4. Carleton, A.M., **Antarctic sea ice—atmosphere signal of the southern oscillation,** International Conference on Southern Hemisphere Meteorology, 2nd. Proceedings, Boston, American Meteorological Society, 1986, p.431-434, 17 refs.

Interactions between the extreme phases of the Southern Oscillation (SO) and antarctic sea ice parameters (e.g. concentration) at the regional scale have heretofore not been investigated. This paper presents the results of such an analysis for summer ice in the Weddell Sea/South Atlantic for SO events in the period 1929-62. They indicate the presence of an SO signal in the sea ice that arises from antecedent (springtime) anomalies in the sign and magnitude of the meridional component of the surface wind over the southwest Atlantic. (Auth.)

I-36682

Bowman, K.P., **Global trends in total ozone,** *Science,* Jan. 1, 1988 239(4835), p.48-50, 21 refs.

Satellite ozone data from the Total Ozone Mapping Spectrometer from 1979 through 1986 show that recent decreases of total ozone have not been confined to the antarctic spring season (the antarctic ozone hole), but are global in extent. The losses are about twice the estimated uncertainty in the satellite data. The decreases are largest in middle and high latitudes and occur in all seasons of the year. The decreases for this 8-year period are comparable in magnitude to the increases observed during the 1960s. Southern Hemisphere values from 1986 are generally greater than those from 1985. (Auth.)

Makide, Y., **Atmospheric halocarbons in the antarctic area,** *Polar news,* Feb. 1986 No.42, p.10-17, In Japanese.

The atmospheric concentrations of anthropogenic halocarbons such as CCl2F2, CCl3F and CH3CCl3 have been measured in Antarctica as well as in the mid-latitude Northern Hemisphere (Hokkaido). The concentrations of these compounds are steadily increasing in both hemispheres. The total concentration of chlorine atoms in the atmosphere due to the halocarbons will be more than twenty times as large as the natural background concentrations in future with current emission rates of the halocarbons, and a large depletion of the stratospheric ozone is predicted.

Singh, N.P., Trivedi, K.I., Rathore, L.S., Rizvi, S.R.H., **Meteorological observations: 1983-'84 antarctic summer,** *India. Department of Ocean Development. Technical publication,* 1986 No.3, p.21-47.

Extensive meteorological observations of surface and upper air parameters were taken from ship platform during the voyage from Goa to Antarctica and back, and also at Schirmacher Hills station and at Dakshin Gangotri. The important meteorological events, such as storms and blizzards, encountered during the expedition and the antarctic weather are discussed. Variations in observations taken at different locations and observational arrangements made by other countries are also referred to. Specific objectives were to make detailed studies of synoptic weather; to monitor changes in the troposphere and stratosphere; to take synoptic weather observations; to provide weather support for expedition activities and helicopter operations; and to study sea ice conditions and learn sea ice data sources. (Auth. mod.)

I-36743

Rizvi, S.R.H., **Meteorological studies at Dakshin Gangotri (Antarctica) March 1984 to February 1985,** *India. Department of Ocean Development. Technical publication,* 1986 No.3, p.49-73.

The Third Indian Scientific Expedition to Antarctica established a permanent meteorological station at Dakshin Gangotri to monitor both surface and upper air parameters. This report contains results of these observations, continuously taken at this station for one year. The variations in temperature, wind velocity and atmospheric pressure, and their influence on different weather systems are discussed.

The low pressure systems moving over and around Antarctica carry warm and moist air, whereas ridges draw in cold air. Significant fluctuations in temperature, pressure and wind speed have been noticed in moving weather systems. (Auth.)

Farmer, C.B., **Stratospheric trace gases in the spring 1986 antarctic atmosphere,** *Nature,* Sep. 10, 1987 329(6135), p.126-130, 15 refs.

The atmospheric absorption features of over 500 infrared solar spectra recorded at McMurdo Station, have been analyzed to determine the vertical column abundances of trace gases crucial to the understanding of the ozone hole phenomenon. Results are presented in tables and graphs. Between Sep. 15-22 and Oct. 15-22 the chlorine species were found to show large increases, suggesting that during Sep. a major fraction of the total stratospheric chlorine burden is either frozen out or is present in some molecular form other than HCl or ClONO2. The chemical partitioning bewteen HCl and ClONO2 is also highly abnormal during Sep. While this is not proof of a cause and effect relationship between halogenated source gases and the springtime ozone depletion, it is entirely consistent with such hypotheses.

Stordal, F., Garcia, R.R., **Sensitivity studies and a simple ozone perturbation experiment with a truncated two-dimensional model of the stratosphere,** *Journal of geophysical research,* Oct. 20, 1987 92(D10), p.11,909-11,918, 38 refs.

Earlier work is extended by including tracers with photochemical production in the stratosphere (O3 and NOy). Latitudinal variations in the photochemical sources and sinks are included, improving slightly the calculated global mean profiles for the long-lived tracers and improving substantially the latitudinal behavior of ozone. Sensitivity tests of the dynamical parameters in the model are performed, showing that the response of the model to changes in vertical residual meridional winds and horizontal diffusion coefficients is similar to that of a full two-dimensional model. A simple ozone perturbation experiment shows the model's ability to reproduce large-scale latitudinal variations in total ozone column depletions as well as ozone changes in the chemically controlled upper stratosphere. Limitations of the model as a tool for perturbation studies are discussed. The ozone perturbation experiment centers on Antarctica. (Auth. mod.)

Matthews, W.A., Keys, G.J., Johnston, P.V., **Transport and photochemical effects seen in stratospheric NO2 amounts,** *Journal of atmospheric and terrestrial physics,* Nov.-Dec. 1986 48(11-12), p.1093-1097, 14 refs.

Column contents amounts of NO2 were measured from the sites at 45S, 53S and 78S using long path differential absorption spectroscopy. In spring, the two mid-latitude sites exhibit essentially the same smooth winter to summer transition. While this trend is also present in the antarctic data, large amplitude oscillations with a period of approximately 9 days are superimposed on this trend. These oscillations are explained in terms of transport of mid-stratospheric air from more poleward or more equatorial latitudes. The observed night-time decay of NO2 is shown to agree with a simple N2O5 chemical conversion scheme. (Auth. mod.)

Stolarski, R.S., Jackman, C.H., Kaye, J.A., **Diagnostic analysis of two-dimensional monthly average ozone balance with Chapman chemistry,** *Journal of atmospheric and terrestrial physics,* Nov.-Dec. 1986 48(11-12), p.1145-1151, 16 refs.

Chapman chemistry has been used in a two-dimensional model to simulate ozone balance phenomenology. The similarity between regions of ozone production and loss calculated using Chapman chemistry and those computed using LIMS and SAMS data with a photochemical equilibrium model indicate that such simplified chemistry is useful in studying gross features in stratospheric ozone balance. Net ozone production or loss rates are brought about by departures from the photochemical equilibrium condition. Gross features of ozone loss/production (L/P) inferred for the real atmosphere from data are also simulated using only eddy diffusion. Figures with ozone L/P and distribution between 90S and 90N (pressure 0.1-1,000 mb) are presented. (Auth. mod.)

Portniagin, IU.I., Kaĭdalov, O.V., **Tides in the 80-100 km height region,** *Journal of atmospheric and terrestrial physics,* Nov.-Dec. 1986 48(11-12), p.1159-1173, 32 refs.

From long-term continuous wind velocity measurements, by the meteor radar method for the 80-100 km height region, the seasonal and latitudinal variations of atmospheric tides, as well as the spatial and temporal scales of tidal variability, have been determined on Heiss I., at Obninsk and at Molodezhnaya Station. Atmospheric variations with a period of about half-a-day are investigated on the basis of a numerical model. A dependence between the mean wind structure and the semi-diurnal oscillation in the lower thermosphere is established. The influence of stratospheric warmings on semi-diurnal oscillations is also discussed. Numerical experiments show that the

mean wind variations cannot explain the observed seasonal variations of a semi-diurnal tide. (Auth.)

Memmesheimer, M., Gaertner, V., Blum, P.W., **Seasonal transitions and possible polar mesospheric cloud regions calculated by a zonally averaged model of the middle atmosphere,** *Journal of atmospheric and terrestrial physics,* Nov.-Dec. 1986 48(11-12), p.1185-1196, 34 refs.

A global, zonally averaged dynamical model of the middle atmosphere is used to calculate the seasonal variations of winds and temperature from 10 to 110 km. The main purpose of the study is to search for the existence of regions where noctilucent or polar mesospheric clouds (NLC/PMC) may be formed. For this purpose the difference between the actual temperature and the frost point is calculated based on a fixed water vapor mixing ratio. Possible cloud existence regions (PCR) are defined by the condition that the actual temperature is below the frost point inside the PCR. It is found that this is the case for the summer polar mesopause during May-Aug. (in the Northern Hemisphere) and Nov.-Feb. (in the Southern Hemisphere). The PCR extends from the pole to approximately 60 deg latitude at a height of about 85 km. In addition, in the lower stratosphere during winter the temperature also falls below the frost point, approximately at an altitude where stratospheric clouds are observed. (Auth. mod.)

Jakobs, H.J., Bischof, M., Ebel, A., Speth, P., **Simulation of gravity wave effects under solstice conditions using a 3-D circulation model of the middle atmosphere,** *Journal of atmospheric and terrestrial physics,* Nov.-Dec. 1986 48(11-12), p.1203-1223, 39 refs.

Vertically propagating gravity waves can transport momentum and energy from the troposphere up to the mesosphere and thus modify the circulation of the middle atmosphere. The effects of regional gravity wave sources, together with temporal changes of gravity wave activity, are studied under solstice conditions in a 3-D circulation model using a simplified parameterization scheme for the gravity momentum deposition. The reversal is reproduced of the mean zonal wind with height and very low temperatures at the summer mesopause region. Using a stochastic forcing by taking the gravity wave parameters at random, characteristic oscillations are found with periods in the planetary scale range (2, 4 and 5 days) and in the tidal range (1 day, 16 h and 12 h). De Mora, S.J., Patterson, J.E., Bibby, D.M., **Atmospheric mercury concentrations inside Scott Base,** *New Zealand antarctic record,* 1987 8(1), p.5-8, 12 refs.

A survey of mercury levels inside Scott Base was conducted as part of a study of atmospheric mercury in the Ross Dependency. Baseline concentrations of atmospheric mercury are known to be low in remote locations. Concentrations of the order of 1-2 ng/cu m are typically observed for clean air and even in urban environments tend to be well below 100 ng/cu m. Mercury in air samples at sites near Scott base was analyzed using a mercury detector within the base. Thus, the air survey within the base was a necessary precaution to check for local contamination. At the same time, sampling and analytical procedures could be tested, in particular ensuring suitable blanks and detection limits were attainable. Results of the collection and analysis of the air samples are discussed. (Auth.)

Shell, E.R., **Solo flights into the ozone hole reveal its causes,** *Smithsonian,* Feb. 1988 18(11), p.142-155.

The 8-week Airborne Antarctic Ozone Experiment, carried out by an international team of scientists and technicians with the object of finding out why the stratosphere above Antarctica loses nearly half of its ozone every year, is described. Two theories, one meteorological and the other chemical, are discussed. The dynamics of the chemicals of most concern, the CFCs, and the controversy over whether ozone is being destroyed by chlorine in the stratosphere or not, are reviewed. The details of the project, consisting of 7 experiments conducted from 2 airplanes, one cruising over the antarctic continent at 40,000 feet taking measurements, the other flying into the hole itself, are given. The results show a clear connection between high chlorine levels and ozone depletion; the situation is likened to a low-temperature flame burning over an area the size of a continent, and an appeal is made to reduce the fuel for this flame.

Zabel, F., **Possible anthropogenic causes for the antarctic ozone hole** [Das antarktische Ozonloch—anthropogene Ursachen?], *Chemie in unserer Zeit,* Oct. 1987 21(5), p.141-150, In German. 27 refs.

The problem of the atmospheric ozone hole over Antarctica is reviewed and man's part in its creation is examined. Since the area of ozone depletion over Antarctica has been steadily increasing for the last ten years, the question is posed whether this might be the first indicator with which to forecast global proportions for the condition. Ozone measurements made at the South Pole are introduced and the prevailing hypotheses explaining the phenomenon are discussed.

Fraser, P.J., Hyson, P., **Methane, carbon monoxide and methylchloroform in the Southern Hemisphere,** *Journal of atmospheric chemistry,* Mar. 1986 4(1), p.3-42, Refs. p.29-33.

New observational data on CH4, CO and CH3CCl3 in the Southern Hemisphere are reported. The observational sites include several antarctic stations. The data are analyzed for long term trends and seasonal cycles. CH3CCl3 data are used to scale the OH fields incorporated in a two dimensional model, which in turn, is used to constrain the magnitude of a global CH4 source function. The possible causes of observed seasonality of CH3CCl3, CH4 and CO are identified, and several other aspects of observed CH4 variability are discussed. Possible future research directions are also given. (Auth. mod.)

Pearman, G.I., Hyson, P., **Global transport and inter-reservoir exchange of carbon dioxide with particular reference to stable isotopic distribution,** *Journal of atmospheric chemistry,* Mar. 1986 4(1), p.81-124, Refs. p.117-122.

A two-dimensional model of global atmospheric transport is used to relate estimated air-to-surface exchanges of carbon dioxide (CO2) to spatial and temporal variations of atmospheric CO2 concentrations and isotopic composition. The atmospheric model coupled with models of the biosphere and mixed layer of the ocean describes the gross features of the global carbon cycle. In particular this paper con-

siders the change in isotopic composition due to interreservoir exchanges and thus the potential application and measurement requirements of new isotopic observational programs. Tabulated data, obtained at selected observatories around the world, including the Falkland Is. and Palmer and Amundsen-Scott stations, are presented. A comparison is made between the model-generated CO2 concentration variation and those observed on secular, interannual and seasonal time scales and spatially through the depth of the troposphere and meridionally from pole-to-pole. (Auth. mod.)

Thompson, M.L., Enting, I.G., Pearman, G.I., Hyson, P., **Interannual variation of atmospheric CO2 concentration,** *Journal of atmospheric chemistry,* Mar. 1986 4(1), p.125-155, Refs. p.151-154.

A method is described for the analysis of the interannual variability of background atmospheric carbon dioxide concentration. The analysis is carried out on the data from 6 observatories including that at the Amundsen-Scott Station, for which records of >8 years were available. A global-scale interannual variation of CO2 concentration in the troposphere with a characteristic time-scale of 2-3 years has been confirmed throughout the period of the records. The interannual variations of CO2 increase are found to be correlated with those observed in data for Pacific sea surface temperatures and Pacific wind stress, the Southern Oscillation Index and the Quasi-Biennial Oscillation. Ayers, G.P., Ivey, J.P., Goodman, H.S., **Sulfate and methanesulfonate in the maritime aerosol at Cape Grim, Tasmania,** *Journal of atmospheric chemistry,* Mar. 1986 4(1), p.173-185, 15 refs.

High-volume aerosol filters, exposed in maritime air masses at Cape Grim since late 1976, were analyzed for excess sulfate (not of seasalt origin) and methanesulfonate. The mean concentrations (standard errors) of 2.80(0.59) and 0.176(0.027) nmole/cu m respectively are about half those reported in a recent study of aerosol samples from various locations in the Atlantic and Pacific oceans. Tabulated data on methanesulfonate in precipitation at places other than Cape Grim, show values of 85 (nmole/L) in antarctic firn, 10 km inland from Mawson Station during Jan. 1984, and 267, at 62 deg 08'S and 98 deg 57'E, on Jan. 11, 1984, respectively. Chuan, R.L., Palais, J., Rose, W.I., Kyle, P.R., **Fluxes, sizes, morphology and compositions of particles in the Mt. Erebus volcanic plume, Dec. 1983,** *Journal of atmospheric chemistry,* Dec. 1986 4(4), p.467-477, 14 refs.

The flux of particles and their size distribution, determined at Mt. Erebus showed that plume contributes 21 metric tonnes/day of aerosol particles to the antarctic upper troposphere. The aerosol particles consist of larger particles of elemental sulfur and silica, a middle sized group of iron oxides and smaller particles (less than 1 micron) of complex liquids. Unlike many volcanic plumes, the Erebus plume has only a small amount of sulfate particles. The concentrations of particles in the Erebus plumes was 70-370 micron/cu m. Limited sampling of the antarctic atmosphere at 8 km altitude, but hundreds of km away from Erebus, obtained a few large particles of sulfur and silicates, suggesting a similarity with the Erebus plume. The fallout of these particles occurs slowly over a broad area of the antarctic continent. (Auth. mod.)

Molina, M.J., Tso, T.L., Molina, L.T., Wang, F.C.Y., **Antarctic stratospheric chemistry of chlorine nitrate, hydrogen chloride, and ice: release of active chlorine,** *Science,* Nov. 27, 1987 238(4831), p.1253-1257, 36 refs.

The reaction rate between atmospheric hydrogen chloride (HCl) and chlorine nitrate (ClONO2) is greatly enhanced in the presence of ice particles. This reaction could play an important role in explaining the observed depletion of ozone over Antarctica; it releases photolytically active chlorine from its most abundant reservoir species, and it promotes the formation of HNO3 and thus removes nitrogen dioxide (NO2) from the gas phase. Hence it establishes the necessary conditions for the efficient catalytic destruction of ozone by halogenated free radicals. In the absence of HCl, ClONO2 also reacts irreversibly with ice with a collision efficiency of about 0.02 at 200 k; the product hypochlorous acid (HOCl) is released to the gas phase on a time scale of minutes. (Auth. mod.)

I-36897

Tolbert, M.A., Rossi, M.J., Malhotra, R., Golden, D.M., **Reaction of chlorine nitrate with hydrogen chloride and water at antarctic stratospheric temperatures,** *Science,* Nov. 27, 1987 238(4831), p.1258-1260, 20 refs.

Laboratory studies of heterogeneous reactions important for ozone depletion over Antarctica are reported. The reaction of chlorine nitrate (ClONO2) with H2O and hydrogen chloride (HCl) on surfaces that simulate polar stratospheric clouds [ice and nitric acid (HNO3)-ice and sulfuric acid] are studied at temperatures relevant to the antarctic stratosphere. A reaction produced gas-phase hypochlorous acid (HOCl) and condensed-phase HNO3; HOCl underwent a secondary reaction on ice producing dichlorine monoxide (Cl2O). In addition to the reaction with H2O, ClONO2 reacted with HCl on ice to form gas-phase chlorine (Cl2) and condensed-phase HNO3. Essentially all of the HCl in the bulk of the ice can react with ClONO2 on the ice surface. The gaseous products of the above reactions, HOCl, Cl2O, and Cl2, could readily photolyze in the antarctic spring to produce active chlorine for ozone depletion. Furthermore, the formation of condensed-phase HNO3 could serve as a sink for odd nitrogen species that would otherwise scavenge the active chlorine. (Auth. mod.)

I-36914

Szeredi, I., Karoly, D., **Vertical structure of monthly fluctuations of the Southern Hemisphere troposphere,** *Australian meteorological magazine,* Mar. 1987 35(1), p.19-30, 9 refs.

Using rawinsonde data from up to 48 stations for the period 1950-1979, the dominant vertical modes of monthly fluctuations of geopotential height, temperature and wind have been identified. Each of these modes has been characterized in terms of fluctuations of each variable at a single level. This has permitted the representation of a large fraction of the variance of monthly fluctuations of the SH troposphere using a small number of variables only. An equivalent barotropic structure was predominant for all variables at higher latitudes. At lower latitudes, a more baroclinic structure was evident although the barotropic mode was still important. An analysis of all variables combined indicates that geopotential height and winds at the 300 hPa level represent well the monthly fluctuations at all levels in the troposphere. Data from Mawson, Casey, SANAE, Argentine Island Stations on the Continent and from various ones of the subantarctic islands were used in the preparation of this analysis. (Auth.)

Gaĭgerov, S.S., **Winter variation statistics of antarctic upper air meteorological parameters** [Statisticheskie kharakteristiki zimnikh variatsiĭ meteorologicheskikh parametrov v verkhneĭ atmosfere Antarktiki], *Antarktika; doklady komissii,* 1987 No.26, p.19-24, In Russian. 6 refs.

An analysis is presented of winter variations of meteorological parameters in the stratosphere and mesosphere of antarctic and suban-

tarctic regions based on rocket data obtained at Molodezhnaya Station and the Kerguelen Is. Charts with percentage of probable deviations of regional wind speed and temperature are shown.

I-36928
Gaĭgerov, S.S., **Stratospheric and mesospheric warmings in high latitudes of the Southern Hemisphere** [Stratomezosfernye potepleniia v vysokikh shirotakh iuzhnogo polushariia], *Antarktika; doklady komissii,* 1987 No.26, p.25-29, In Russian. 7 refs.

From meteorological satellite data obtained at different latitudes of the Southern Hemisphere, recordings of midwinter stratospheric warmings, which are often slight and irregular, are discussed. In contrast to the intense warmings associated with changes in circulation in the Arctic, this is not observed in the Antarctic, where significant temperature fluctuations, associated with mesospheric circulation, occur in winter.

I-36929
Koshel'kov, IU.P., Butko, A.I., Kovshova, E.N., **Mean geopotential distribution in the lower thermosphere of the Southern Hemisphere** [Srednee raspredelenie geopotentsiala dlia nizhneĭ termosfery iuzhnogo polushariia], *Antarktika; doklady komissii,* 1987 No.26, p.30-36, In Russian. 11 refs.

Data from average monthly geopotential charts of isobaric surfaces (0.001 and 0.005 mb) were used to study the geopotential spatial distribution and seasonal variations in the lower thermosphere. Charts with amplitudes and phases of annual and semi-annual oscillations are discussed; they show that the most significant interhemispheric differences in the distribution of pressure in the lower thermosphere occur in winter.

I-36930
Koshel'kov, IU.P., Kovshova, E.N., Fedorov, V.V., **Short period variability of temperature and wind velocities in the stratosphere and mesosphere of the Southern and Northern hemispheres** [Vnutrimesiachnaia izmenchivost' temperatury i skorosti vetra v stratomezosfere iuzhnogo i severnogo polusharīĭ], *Antarktika; doklady komissii,* 1987 No.26, p.37-41, In Russian. 10 refs.

Seasonal and altitudinal variations and interhemispheric differences in temperature and wind-speed patterns in the 20-80 km atmospheric layer are analyzed on the basis of meteorological rocket soundings conducted at Molodezhnaya Station, the Kerguelen Is., and 2 northern stations. The values are found to increase during the fall season and with altitude; they are higher in the Arctic in winter, and in the Antarctic in spring. The interhemispheric differences are least pronounced in summer.

Tarasenko, D.A., **Temperature variability in the middle atmosphere over the Antarctic** [Izmenchivost' temperatury sredneĭ atmosfery nad Antarktikoĭ], *Antarktika; doklady komissii,* 1987 No.26, p.42-43, In Russian. 8 refs.

Stratospheric and mesospheric temperature variability was studied from rocket sounding data at Molodezhnaya Station. Calculations and variance analysis of recurrence probability of median temperature distribution values show that positive deviations reach the highest values, particularly in the upper stratosphere where often, in winter, the dissipation of planetary waves takes place.

Romanov, V.F., Ariskina, N.V., Vasil'ev, V.F., Lagun, V.E., **Atmospheric energetics in polar regions** [Energetika atmosfery v poliarnykh oblastiakh], Leningrad, Gidrometeoizdat, 1987, 296p., In Russian. Refs. p.282-294.

Experimental data collected during the POLEX program are reviewed and analyzed, covering the following: characteristics of spatial structure of the Antarctic Circumpolar Current, determined by analysis of long series of measurements of currents in the southern ocean; computed zonal mean zonal and meridional components of wind speed representing different seasons; interactions of the atmosphere, ice, and the oceans in polar regions, with emphasis on sea ice, the polar energy balance, and meridional heat exchange processes. Specific to Antarctica, the Soviet-American expedition to the Weddell Sea during Oct.-Nov. 1981 is described in Ch. 4. Atmospheric synoptic eddies and energetics over the sea were studied, including ocean-atmosphere interrelationships such as atmospheric circulation effects on the formation of polynyas in the Weddell Sea. Equations are developed to demonstrate the generation of available potential energy due to turbulent transfer of sensible heat from the ocean to the atmosphere in an ocean cyclone. Charts of cyclone tracks and frequency of cyclones and anticyclones in the Southern Hemisphere are presented.

Karoly, D.J., Oort, A.H., **Comparison of Southern Hemisphere circulation statistics based on GFDL and Australian analyses,** *Monthly weather review,* Sep. 1987 115(9), p.2033-2059, 23 refs.

Two sets of observed atmospheric circulation statistics for the Southern Hemisphere (SH) are compared. The first set was compiled at the Geophysical Fluid Dynamics Laboratory (GFDL) and consists of global objective analyses of circulation statistics accumulated at individual rawinsonde stations for the period May 1963-Apr. 1973. The second set was obtained from daily hemispheric numerical analyses prepared operationally at the World Meteorological Centre, Melbourne, Australia for the period Sep. 1972-Aug. 1982. The domain used for the comparison is a 5 deg x 5 deg latitude-longitude grid from 10 deg to 90 deg S and 7 pressure levels from 1000 to 100 mb. The circulation statistics examined include 10-year averages of the monthly mean fields (measures of the mean circulation); ten-year averages of the standard deviations and covariances of daily values (measures of the daily transient eddy variability); and year-to-year standard deviations of the monthly mean fields (measures of the interannual variability). The statistics are presented using horizontal maps on pressure surfaces and latitude-pressure sections of zonal averages. Differences and agreements, horizontal and vertical are discussed. Probable reasons for disagreements and trends characteristic of the variances in the data sets are presented. (Auth. mod.)

Jouzel, J., **Simulations of the HDO and H2O-18 atmospheric cycles using the NASA GISS general circulation model: the seasonal cycle for present-day conditions,** *Journal of geophysical research,* Dec. 20, 1987 92(D12), p.14,739-14,760, 67 refs.

The cycles of the water isotopic species (HDO and H2O-18) have been incorporated into the NASA Goddard Institute for Space Studies (GISS) atmospheric general circulation model (GCM). The results of a 2-year simulation for present-day conditions are discussed, with special emphasis on the comparison between predicted and observed isotopic distributions for both the seasonal and annual time scales. The observed seasonal cycles are generally well simulated. For the annual scale the observed linear relationship between *delta* O-18 and the surface temperature at middle and high latitudes, as well as the absence of any correlation between these fields in tropical and equatorial regions, are properly obeyed by the GCM simulation. In the tropical and equatorial regions the *delta* O-18 patterns for both observations and the GCM are influenced by the amount of rainfall. There is excellent agreement between the simulated and observed *delta* D-*delta* O-18 relationship throughout the world. The antarctic regions are included in the analyses shown on the charts of world wide parameters being modelled. (Auth.)

Trenberth, K.E., Christy, J.R., Olson, J.G., **Global atmospheric mass, surface pressure, and water vapor variations,** *Journal of geophysical research,* Dec. 20, 1987 92(D12), p.14,815-14,826, 19 refs.

An analysis is made of the mean annual cycle, interannual variability and trends in global-scale water vapor content of the atmosphere for Dec. 1978 through Dec. 1985, using global analyses from the European Centre for Medium Range Weather Forecasts. Two entirely independent global measures of the water vapor content are compared: the total surface pressure due to water vapor from humidity analyses and the total surface pressure itself. For the mean annual cycle these show excellent agreement, and the analyses are therefore compatible with the constraint that the total mass of dry air is conserved. A new estimate of the total mass of the atmosphere is made for the annual mean, corresponding to a mean surface pressure of 984.43 mbar. It ranges from a higher value in July to a lower one in Jan. owing to the annual cycle in global water vapor which has an amplitude of 0.2 mbar. The total mass of dry air is estimated to be 981.9 mbar. Available evidence indicates that the analyzed global monthly anomalies are mostly noise. (Auth. mod.)

Slotten, H.R., Stearns, C.R., **Observations of the dynamics and kinematics of the atmospheric surface layer on the Ross Ice Shelf, Antarctica,** *Journal of climate and applied meteorology,* Dec. 1987 26(12), p.1731-1743, 15 refs.

Ross I. with its 3000 m volcanic peaks poses a prodigious barrier to the predominant southerly airflow of the western Ross Ice Shelf. This study investigates the relationship of Ross I. to the dynamics and kinematics of the atmosphere using surface data from an array of 6 automatic weather stations on the Ross Ice Shelf just south of Ross I. After the actual horizontal pressure gradients had been determined, dynamical relations were obtained which confirmed previous related research. The values of geostrophic departure angle found in this study are in good agreement with the findings of other researchers. Furthermore, a previously determined tendency of the geostrophic departure angle to increase with increasing wind speed over open ice has been confirmed in the region far to the south of the influence of Ross I. Near the south side of Ross I., however, this relation does not apply. It is postulated that the forcing of Ross I. on the dynamics of the lowest layers of the atmosphere is causing this difference to occur. Through an analysis of the individual terms in the equation of motion, further support was found for this hypothesis. On the assumption of a linear decrease of friction with height, the height for zero friction increases towards the south of Ross I. Finally, tentative evidence of higher pressure immediately to the south of the island has been found, which further supports the theory that the cold stable air advected northward by the predominant southerly flow is piling up on the south side of Ross I. (Auth.)

DLC QC981.8.C5T65

Regimes of low-frequency variability in large-scale atmospheric dynamics are considered. The model used for the study of these regimes is the fully-nonlinear, equivalent-barotropic vorticity equation on the sphere, with simplified forcing, dissipation and topography. Based on recent ideas from dynamical system theory, it is shown that the system's macrodynamics can be described by two or more planetary flow regimes, the expected residence time in each regime, and the transition probabilities from one regime to another.

These model-derived ideas are tested by applying them to a time series of atmospheric data from the Southern Hemisphere. The effect of anomalous boundary conditions on planetary flow regimes and their predictability is discussed and perspectives for practical long range forecasting are foreshadowed. (Auth. mod.)

Reinsel, G.C., **Analysis of the 7-year record of SBUV satellite ozone data: global profile features and trends in total ozone,** *Journal of geophysical research,* Feb. 20, 1988 93(D2), p.1689-1703, 15 refs.

An analysis of Nimbus 7 solar backscattered ultraviolet (SBUV) monthly average total ozone data for changes over the 7-year period from Nov. 1978 through Sep. 1985 is considered. Regression-time series models, which include seasonal components, a linear trend term, a solar flux term, and an autocorrelated autoregressive noise term to account for variations in total ozone, are estimated for both latitudinal zonal averages and a global series over this time period. The resulting linear trend and solar flux coefficient estimates are examined. A comparison between SBUV monthly average total ozone data near Dobson ground station locations and the corresponding Dobson station total ozone data is performed for a network of 35 Dobson stations. Linear drifts are estimated for the differences between SBUV and Dobson total ozone data at each station. The results show an average negative linear drift in SBUV data relative to Dobson data of about -0.4% per year. A linear trend estimate for the global SBUV series of (-0.74% per year) is obtained for the model which takes into account the association of ozone changes with solar flux variations. When this linear trend estimate for the global SBUV series is "corrected" for the negative drift between SBUV and Dobson data, the 95% confidence interval estimate over this 7-year period is -0.35% per year. The many charts and diagrams include data from Antarctica reflecting the recent trend of the thinning spring time ozone layer there. (Auth. mod.)

Ryzhakov, L.IU., Rabtsevich, S.V., **Intensity of zonal and meridional atmospheric transfers in the Southern Hemisphere** [Kharakteristika intensivnosti zonal'nykh i meridional'nykh perenosov v atmosfere iuzhnogo polushariia], *Leningrad. Arkticheskiĭ i antarkticheskiĭ nauchno-issledovatel'skiĭ institut. Trudy,* 1986 Vol.393, p.110-122, In Russian. 13 refs.

Computation of AT500 gradients and surface pressure values for 1960-1979 is presented. Yearly variations of meridional gradient values characterizing the intensity of zonal transfers are shown in long period averages and in a given year. Based on 2-year data, it is found that monthly average meridional gradient anomalies relate to pressure and temperature anomalies. It is suggested that this data could be used in weather forecasting in Antarctica.

Renerie, J., **United States' national ozone expedition statement,** *Environmental conservation,* Winter 1986 13(4), p.353-355.

Based on a report in May 1985 that the springtime antarctic ozone abundance was about 50% smaller than that present in 1975, the ozone hole and various possible clues to its formation are discussed. A U.S. interagency expedition to Antarctica, designed to measure ozone contents in addition to chemicals such as nitric acid and hydrochloric acid in the atmosphere, is reported. A sketch map indicating total stratospheric ozone on Oct. 10, 1986, with a shield of less than 200 Dobson units over much of Antarctica and most of the rest of the continent, and wide expanses of ocean beyond covered by only 250 units, is provided. The preliminary conclusion is reached, that the cause of the ozone hole phenomenon "may well be something that has not yet been thought of."

Hofmann, D.J., Rosen, J.M., Harder, J.W., **Aerosol measurements in the winter/spring antarctic stratosphere. 1. Correlative measurements with ozone,** *Journal of geophysical research,* Jan. 20, 1988 93(D1), p.665-676, 26 refs.

From Aug. 25 to Nov. 3, 1986 aerosol profiles were measured on 6 occasions at McMurdo Station by balloon-borne optical particle counters. In addition, condensation nuclei profiles were measured on 3 occasions. Several of these measurements corresponded to times when McMurdo was located near the point of minimum springtime ozone, as indicated by ozone and temperature measurements. The height of the stratospheric sulfate layer decreased over the period of measurement, indicating continued subsidence in the vortex while the ozone was decreasing. This suggests that upwelling in the vortex is not important in the ozone depletion process. Low concentration of condensation nuclei in the region of the ozone minimum supports this conclusion. Enhanced condensation nuclei above 20 km in the vortex and the discovery of an apparent permanent layer in the springtime vortex at the top of the ozone depletion region suggests that they may be related to the ozone depletion process, although the nature of this relationship is not clear. (Auth.)

Rosen, J.M., Hofmann, D.J., Harder, J.W., **Aerosol measurements in the winter/spring antarctic stratosphere. 2. Impact on polar stratospheric cloud theories,** *Journal of geophysical research,* Jan. 20, 1988 93(D1), p.677-686, 28 refs.

A series of aerosol soundings sensitive to particle sizes less than about 1 micron was made from McMurdo beginning in Aug. 1986, while the stratosphere was still cold, and continued through the spring warming and polar vortex circulation breakdown. No unusual or definitive features in the profiles were noted that could unquestionably be associated with PSCs. Photographically documented ground observations indicate that there was very likely a PSC or unusual stratospheric aerosol condition present during the first sounding at about 20 km. These aerosol observations impact the present explanations of PSCs and indicate that the possibility of these clouds being made up of low concentrations of relatively large (greater than 5 micron) particles must be taken seriously. The low concentrations would effectively render the PSCs undetectable by the aerosol-sounding equipment employed in this study. It is argued that the fall speed associated with the cloud particles would not measurably change the natural aerosol profile, but that there could be a tendency for some water vapor to be transported to lower altitudes. Because of atmospheric mixing and transport processes, the redistribution of water vapor may not be easily detected. (Auth.)

Savitskiĭ, G.B., Beliazo, V.A., Riabkov, G.E., Fedosov, M.K., **Terminology and evaluation of accuracy of 3-day weather forecasts in Antarctica** [K voprosu o terminologii i otsenke opravdyvaemosti prognozov pogody na troe sutok dlia Antarktiki], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1987 Vol.109, p.58-63, In Russian. 3 refs.

Basic prognostic relationships among atmospheric processes are established from the tropospheric thermobaric structure and its variations and from certain associations of the processes with stream flows. Methods are suggested for prognoses, and evaluation of their accuracy, of direction and speed of wind and of prevailing air temperatures.

I-37071

Sakunov, G.G., Mishin, A.A., Radionov, V.F., **Anomalous decrease of atmospheric transparency over Antarctica** [Anomal'noe ponizhenie prozrachnosti atmosfery nad Antarktidoĭ], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1987 Vol.109, p.66-69, In Russian. 5 refs.

Data from investigations carried out at Mirnyy Station in Jan.-Mar. 1983, during the 28th Soviet Antarctic Expedition, show a significant decrease of atmospheric transparency for that period. In Jan., the monthly average values were approximately 6% lower than the long period averages recorded at Molodezhnaya and Novolazarevskaya stations. This decrease was observed to have begun in Nov.

1982, and is attributed to increased aerosol content in the atmosphere. Effects of the Apr. 4, 1982, eruption of El Chichon on the visual atmospheric anomaly are considered.

Pavlov, A.IU., **Hydrometeorological regime of the southern ocean in summer 1982-1983** [Gidrometeorologicheskiĭ rezhim IUzhnogo okeana letom 1982-1983], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1987 Vol.109, p.80-83, In Russian. 6 refs.

Results of hydrometeorological investigations, carried out in the low pressure zone at 61-62S by the 28th Soviet Antarctic Expedition during Dec. 1982-Apr. 1983 are given as follows: lowest pressure, 969 mbar; wind speed, 25 m/sec; height of the swell, 7 m. Long period averages for recurrence of basic hydrometeorological characteristics are compared to the expedition's data, which are tabulated and discussed. In considering navigation conditions, it is found that the higher the latitude, the lower the visibility, while precipitation increased from 29% at 40-50S, to 42% at 50-60S and to 50% south of 60S in relation to long-period averages. The highest precipitation ratio was found in the coastal waters of the Pacific sector, where it exceeded 58%. Precipitation in the coastal areas of the continent consists of short snowfalls of 10-20 min. duration. Data on sea ice distribution show the highest concentration of icebergs to occur in the Davis Sea, where they drift at an average speed between 0.4 to 0.9 knots, but sometimes reaching 2 knots.

Prather, M.J., Rodriguez, J.M., **Antarctic ozone: meteoric control of HNO3,** *Geophysical research letters,* Jan. 1988 15(1), p.1-4, 32 refs.

Atmospheric circulation leads to an accumulation of debris from meteors in the antarctic stratosphere at the beginning of austral spring. The major component of meteoric material is alkaline, comprised predominantly of the oxides of magnesium and iron. These metals may neutralize the natural acidity of stratospheric aerosols, remove nitric acid from the gas phase, and bond it as metal nitrates in the aerosol phase. Removal of nitric acid vapor has been previously shown to be a critical link in the photochemical depletion of ozone in the antarctic spring, by allowing for increased catalytic loss from chlorine and bromine. (Auth.)

Leu, M.-T., **Laboratory studies of sticking coefficients and heterogeneous reactions important in the antarctic stratosphere,** *Geophysical research letters,* Jan. 1988 15(1), p.17-20, 16 refs.

Laboratory studies of sticking coefficients of H2O, HCl, Cl2 and HNO3 on ice and heterogeneous reactions of ClONO2 with ice or HCl/ice have been performed in a fast flow reactor. A quadrupole mass spectrometer with electron impact ionization was used as a detector. The reaction probability of ClONO2 on ice was 0.06 while HOCl was observed as a sole product in the gas phase. With HCl present in ice, the reaction probability of ClONO2 is greatly enhanced, approaching 0.27 (+0.73, -0.13) while moleuclar chlorine was the major product in the gas phase. Another reaction product was nitric acid which remained in the solid phase. Since the polar stratospheric clouds contain ice particles or possibly HCl/ice particles on the surface, the present results should be a major factor in producing the observed springtime ozone depletion in the antarctic stratosphere. Hanson, C.S., ed, Spears, C.R., ed, **Workshop on the U.S. Antarctic Meteorological Data Delivery System,** *World Data Center A for Glaciology. Glaciological Data. Report,* Jan. 1988 GD-20, 76p., 8 refs. Includes comments by P. Dalrymple, D. Bromwich, W. Smythe, and G. Scharfen.

Concerns over access to meteorological data from U.S. antarctic stations have been the subject of much discussion among organizations closely involved in weather matters. Several factors have apparently led to a somewhat confused picture of data access in the minds of potential data users: delays in data receipt both at the ultimate archive(s) and at transmission stations along the route to the archive(s); non-standardized reporting methods and formats; no permanent archive for the data in question; no permanent source of funding to process and archive the data; and archive locations not widely known within the research community. This workshop was convened to address these problems. To that end, participants examined antarctic data inventories from the National Climatic Data Center, National Center for Atmospheric Research, Naval Postgraduate School, Comprehensive Ocean-Atmosphere Data Set, U.S. Interim Climate Data Inventory, and the National Snow and Ice Data Center. About 25 recommendations emerged from the conference and these urged all interested parties to increase the antarctic meteorological measurement capability, gather more data through wider and better use of current technology, subject the data to rigid quality control processes, communicate the results to using agencies and archives, and let researchers and other users know who has what and how to gain access to it.

Rees, J.M., **Propagation of internal gravity waves in the stably stratified atmospheric boundary layer,** *Annales geophysicae,* Oct. 1987 5B(5), p.421-432, 13 refs.

Under conditions of strong stable stratification in the atmospheric boundary layer, the smaller scale turbulence is often accompanied by larger scale organized wave activity. This is probably due to Kelvin-Helmholtz instability. An extreme example occurs in the Antarctic, where stable stratification is common and there may be a temperature difference over the lowest 10 m of as much as 10 C. Observations of strong wave activity occurring under these conditions are described. A numerical study has been undertaken to examine the propagation of such waves. The model solves the unsteady, Boussinesq equations in two dimensions with parameterized turbulence depending on the larger scale flow. A comparison of the waves predicted by the numerical model and those observed in the Antarctic is

given. It is shown that only waves with a wavelength greater than some critical value are likely to propagate to the ground. This is in agreement with a prediction made by McIntyre and Weissman (1978). (Auth.)

Elliott, S., Rowland, F.S., Stolarski, R.S., Schoeberl, M.R., **Comment on "Further interpretation of satellite measurements of antarctic total ozone",** *Geophysical research letters,* Feb. 1988 15(2), p.196-199, Includes reply by Schoeberl and Stolarski (SS). 11 refs. For the paper being discussed see I-34957.

The purpose of the comment by ER is to maintain that the best explanation for the 1980-1982 TOMS data, which showed deeper ozone "holes" than in 1979, is a near-cancellation between an ozone source and a newly developed chemical sink for ozone, with both initiated by the arrival of spring in the Southern Hemisphere. SS dispute this by stating that reprocessed data for 1979-1982 and data for 1983-1986 are now available and that these data confirm a significant decline in mid-latitude ozone during the past decade.

Yoden, S., Shiotani, M., Hirota, I., **Multiple planetary flow regimes in the Southern Hemisphere,** *Meteorological Society of Japan. Journal,* Aug. 1987 65(4), p.571-585, 29 refs.

An observational study is made of low-frequency variations of the general circulation in the Southern Hemisphere troposphere with the aid of daily data analyzed at the National Meteorological Center (NMC). In the winter of 1983 there exist two typical patterns of the zonal mean geostrophic wind in the meridional plane. They are named the single jet regime and the double jet regime, each of which persisted with a characteristic duration of a month and appeared twice alternatively. In the single jet regime, the subtropical jet at the tropopause level is strong and the stationary wave of zonal wavenumber (WN=) 3 has a larger amplitude than WN=2. On the other hand, in the double jet regime the subtropical jet is weak and the polar night jet extends down to the surface at about 55 deg S. Dominant stationary planetary waves are WN=1 and 2. These two regimes are also observed in the 3 years 1980-1982. An empirical orthogonal function (EOF) analysis is made to define an index of the zonal mean wind of 2 dimensions. The first component of EOF, which represents over 40% of the total variance, corresponds to the variances between the two regimes. The amplitude of this component is used as a kind of 'zonal index'. The transition between the regimes is rather rapid compared with the duration of each regime. No clear relation is found between the regime transitions and the annual variation. These observational evidences support an interpretation that this low-frequency variation of the zonal index is the transition between multiple planetary flow regimes in the Southern Hemisphere. The data are analyzed for latitudes to 80S. (Auth. mod.)

Dickinson, R.E., Meehl, G.A., Washington, W.M., **Ice-albedo feedback in a CO2-doubling situation,** *Climatic change,* July 1987 10(3), p.241-248, 8 refs.

The feedback of sea-ice change to the warming from CO2-doubling is estimated using the simulation of Washington and Meehl (1984). Without ice-snow albedo feedback, their global warming of 3.5 C would have been 2.2 C according to the present estimate of the ice-snow feedback. About 80% of the albedo change from ice and snow occurred in the Southern Hemisphere. Whether this change was an overestimate will require further study. (Auth.)

Kitano, Y., Tanaka, M., **Atmospheric carbon dioxide problem,** *Oceanus,* Spring, 1987 30(1), p.78-82, 8 refs.

Carbon dioxide-induced climate change and its influence on the world food supply and sea level rise are discussed. Atmospheric sources and sinks of CO2 are identified and a new apparatus for continuous measurement of atmospheric CO2 levels, developed at Tohoku University, is described. Tropospheric CO2 measurements documented over Japan are summarized, as are antarctic and Pacific measurements. Data from Showa Station show that a regular diurnal variation was not observed; a seasonal variation was observed with the minimum concentration in mid-Apr. and the maximum in mid-Oct.: annual mean concentrations were 341.2 and 342.6 ppm for the years 1983 and 1984, respectively; and irregular variations were sometimes observed with extremely small amplitudes of 0.2 ppm. It is concluded that despite the large amount of accumulated data, it remains difficult to evaluate quantitatively the net exchange rate of CO2 between the global atmosphere and the ocean.

Lagun, V.E., Romanov, V.F., IAzev, A.I., **Climatic eddies in the atmosphere of the Southern Hemisphere,** *Soviet meteorology and hydrology,* 1987 No.10, p.8-17, Translated from Meteorologiia i gidrologiia. 23 refs.

Presented are the results of diagnostic investigations of eddy dynamics and energetics of the Southern Hemisphere according to climate data. Analysis of statistical parameters of eddy dynamics and energetics revealed the presence of regions of synoptic activity (SAR) in which the frequency of synoptic eddies (SE) is much higher than the global average and the entire life cycle of most SE takes place. At the southern boundary of the cyclonic climatic eddies (CCE) the meridional movement of the CCE is blocked by ridges of the antarctic anticyclone, as well as by unfavorable conditions for their further movement to the south in connection with the orography, the influence of sea ice, and the antarctic ice shield. Within SAR synoptic eddies are stable, reach maximal intensity, and form climatic eddies (CE) in climatic fields which are similar in structure, dynamics, and energetics to typical SE. The seasonal features of the behavior of CE are studied. It is shown that energy-active regions are localized in CE, about the mechanisms of formation of CE. (Auth. mod.)

Bugaeva, I.V., Riazanova, L.A., Butko, A.I., **Stratospheric and mesospheric processes over the Southern Hemisphere in winter 1985,** *Soviet meteorology and hydrology,* 1987 No.10, p.89-92, Translated from Meteorologiia i gidrologiia. 3 refs.

Analysis of radiosonde and rocket data for Molodezhnaya Station, in conjunction with SATEM satellite measurements in winter 1985, established the presence of anomalous warmings in the stratosphere and mesosphere of the Southern Hemisphere which occur on a change in the meteorological fields. The formation of heat is initially observed at mesospheric levels, then descends into the stratosphere. In this case the penetration of heat into the subjacent layers did not take place. Maximal heating was noted in the layer of 35-45 km and was more than 40 C. (Auth.)

Borisenkov, E.P., **Ozone hole over Antarctica,** *Soviet meteorology and hydrology,* 1987 No.10, p.97-104, Translated from Meteorologiia i gidrologiia. 11 refs.

The available factual data for 1979-1985 which characterize the development of an ozone hole in the antarctic ozonosphere are analyzed. Discussed are existing theories about the mechanisms which determine the formation and dynamics of the ozone hole based on published materials and discussions of this problem at a special seminar in Aspendale (Australia) in Dec. 1986. It is shown that of the 3 proposed mechanisms for the formation of the ozone hole the most preferable is related to solar activity. However, it is still too early to accept unequivocally a given hypothesis for explaining this process. (Auth.)

Van Heerden, J., **Analysis of the 1000-300 hPa thickness field using satellite imagery,** *South Africa. Weather Bureau. Technical paper,* Oct. 1985 No.15, 27p., 6 refs.

The paper covers particularly the portion of the Southern Hemisphere of meteorological interest to South Africa including the antarctic region. The thickness analysis is based on the interpretation of cloud conditions which appear on satellite imagery. A set of five basic interpretive principles is presented and from these principles are derived all other analysis rules. Physical and mathematical justification is provided for these precepts and their applications are summarized. The basic interpretive principles identify indicators of warm advection, upper air ridges, cold advection and subsidence, weak thermal advection, upper level divergence, and vorticity. The analysis rules developed from these principles are applied to such parameters among others, as vertical motion fields, locations of cold pools, vertical shear, ridge axes and widths, frontal bands, and surface vortices.

Faure, H., **Amplifying mechanism for the climatic cycle: the "sea ice lid effect" controls the changes in atmospheric carbon dioxide** [Mécanisme d'amplification du cycle climatique global: l'effet de couvercle de la glace de mer contrôle le CO2 atmosphérique], *Académie des Sciences, Paris. Comptes rendus. Ser.2,* July 30, 1987 305(6), p.523-527, In French with English summary. 23 refs.

Sea-ice extension at the end of a glacial cycle constitutes a CO2-tight lid on the cold oceanic surface waters of both hemispheres. Thus, the global ocean is no longer a sink for atmospheric CO2 because of this "sea-ice lid effect". The rapid increase of CO2 in the atmosphere, together with a rise in sea level is responsible for the accelerated temperature increase and sea-ice melting. The cold oceans, freed from their ice lid can become a CO2 sink. A new glacial cycle may thus be triggered. (Auth.)

Parrish, A., **Extremely low N2O concentrations in the springtime stratosphere at McMurdo Station, Antarctica,** *Nature,* Mar. 3, 1988 332(6159), p.53-55, 21 refs.

Frequent measurements have now been made of stratospheric nitrous oxide using the Stony Brook millimetre-wave remote sensing spectrometer at McMurdo Station as part of the investigation of the 'ozone hole'. These measurements show N2O mixing ratios that are less than 1/5 at 20 km, and less than 1/10 at 25 km of those measured during the antarctic summer. Observed mixing ratios are also much less than those predicted by global-scale models of stratospheric chemistry and dynamics. As the N2O signal remained very weak when McMurdo was at the edges of the ozone hole and showed no signs of recovering during Oct., it is concluded that the geographical and temporal extent of the region of low N2O is comparable to, or greater than that of the ozone hole. The results argue against theories that require springtime upwelling to explain the antarctic ozone hole, and suggest that the air in the antarctic lower stratosphere during late winter and early spring has been subjected to considerable downward transport. (Auth. mod.)

Heath, D.F., **Non-seasonal changes in total ozone column from satellite observations, 1970-1986,** *Nature,* Mar. 17, 1988 332(6161), p.219-227, 29 refs.

Analyses of non-seasonal changes in total column ozone from satellite observations during the period 1970-86 suggest, when com-

bined with analyses of Dobson network data, that the largest reduction in global ozone since 1959 occurred between 1978 and 1986. The existence of an arctic region of enhanced ozone depletion with similar but less pronounced characteristics of the antarctic region is described. Before 1983 large rates of decrease were confined to high latitudes, subsequently regions of large rates of ozone depletion have appeared at mid-latitudes. Comparisons are made between Northern and Southern Hemispheres on the basis of measurements over the equatorial regions, mid-latitudes north and south, and both polar regions. (Auth. mod.)

Khalil, M.A.K., Rasmussen, R.A., **Carbon monoxide in the Earth's atmosphere: indications of a global increase,** *Nature,* Mar. 17, 1988 332(6161), p.242-245, 20 refs.

Increasing levels of CO can lead to an increase of tropospheric O3 and a build-up of many other trace gases in the Earth's atmosphere, which may in turn cause widespread perturbations of tropospheric chemistry, global warming and other climatic changes. During the past 6-8 years systematic measurements have been taken of CO at sites ranging from within the Arctic Circle to the South Pole. The rates of increase of the globally averaged concentration are between 0.8% and 1.4% per year depending on the statistical method used for estimating the trends. These increases may have gone on for much longer because more than half of the atmospheric CO now comes from anthropogenic sources. The rates of increase are largest at mid-northern and tropical latitudes, where most of the sources are located. (Auth. mod.)

Abramov, R.V., **Large-scale dynamic characteristics of the subantarctic atmosphere over the Atlantic and Indian oceans** [O krupnomasshtabnykh dinamicheskikh kharakteristikakh atmosfery Atlantiko-Indookeanskoĭ Subantarktiki], *Vsesoiuznyĭ nauchno-issledovatel'skiĭ institut gidrometeorologicheskoĭ informatsii-mirovogo tsentra dannykh. Trudy,* 1986 No.122, p.71-79, In Russian. 4 refs.

Results are presented of an analysis of atmospheric pressure fields, averaged on 10 consecutive weeks between 35 and 60S, over the Atlantic and Indian oceans. A quasi-stationary center of low pressure was established in the southern zone of the stable western transport, between 55 and 65S. Four-day oscillations were found in the variations of the meriodional pressure gradient. Vortex and gradient vector divergence of atmospheric pressure are calculated, showing the possibility of linking these characteristics to the Antarctic Circumpolar Current.

Shirochkov, A.V., Maurits, S.A., **Influence of solar proton flares on changes of antarctic stratospheric temperature regime** [Vliianie solnechnykh protonnykh vspyshek na izmenenie temperaturnogo rezhima v stratosfere Antarktiki], *Leningrad. Arkticheskiĭ i antarkticheskiĭ nauchno-issledovatel'skiĭ institut. Trudy,* 1986 Vol.405, p.125-131, In Russian. 5 refs.

Data on antarctic stratospheric temperature changes at the 50-200 gPa levels (20-10 km), and the phenomenon of spring build-up for the years 1957-1980, are examined with the following results: a relationship between solar flares and temperature profiles is established; seasonal changes of the vertical temperature gradient can be observed 2-3 weeks ahead of time; the physical mechanism of the phenomenon is proposed, linking it to the redistribution of ozone warm-up of the stratosphere during the solar proton events.

Gaffney, D., Casey, T., **Seasonal climate summary southern hemisphere (summer 1986-87): a season of characteristic ENSO anomalies and low planetary wave numbers,** *Australian meteorological magazine,* June 1987 35(2), p.65-77, 11 refs.

An analysis of the Southern Hemisphere circulation for the summer months of Dec. 1986 to Feb. 1987, inclusive, is undertaken. Emphasis is given to the Australian region; an area roughly bounded by Antarctica, the equator, the dateline and 90 deg E. Extratropical anomalies in the atmospheric circulation which developed following the establishment of the tropical El Nino Southern Oscillation (ENSO) related anomalies are discussed, in particular, the ENSO-induced weakening of the mid-latitude westerlies in the Australian region. (Auth.)

Callaghan, J., Betts, M.S., **Some cases of westward moving disturbances in the Mawson-Davis area, Antarctica,** *Australian meteorological magazine,* June 1987 35(2), p.79-85, 4 refs.

Westward moving cloudbands have been observed in the area of Antarctica between the Australian stations of Mawson and Davis when there was cyclonic activity along the coast to the east. An examination of several events of this character, which occurred during the summer of 1983/84 and in Jan. 1972, has been carried out. The passage of the cloudbands was accompanied by a barograph trace minimum, with precipitation occurring on the rising barometer following a sharp fall. The vertical structure of one event, when rare inland upper wind data were available, is discussed. A strong middle to upper tropospheric baroclinic zone appeared to develop over the Lambert Glacier-Prince Charles Mountains area as warm air from a cyclone to the east met colder air flowing off the east Antarctic Plateau. Mofsy, S.C., **Interactions between HCl, NOx, and H2O ice in the antarctic stratosphere: implications for ozone,** *Journal of geophysical research,* Mar. 20, 1988 93(D3), p.2442-2450, 42 refs.

Thermodynamic properties of solid phases containing H2O and HCl are examined for conditions expected over Antarctica in winter. It is shown that solid solutions with 0.02-0.035 mole fraction HCl in H2O ice will form in the stratosphere at temperatures between 193 deg and 190 deg K. Crystalline HNO3(centered dot)H2O and/or HNO3(centered dot)3H2O form in the same temperature range. Thus condensation of small quantities of H2O (<1 ppm) leads to nearly complete removal of both HCl and HNO3 from the gas phase. Formation of ice-HCl solid solutions provides a favorable setting for the heterogeneous reaction of HCl with ClNO3, initiating a rapid sequence of reactions that converts solid-phase HCl into gaseous ClNO3 or chlorine oxide radicals. The cycle producing reactive chlorine gases is likely to be completed before particles grow large enough to fall from the stratosphere. Hence precipitation of particles from the polar stratospheric clouds is expected to remove odd nitrogen from the stratosphere efficiently, leaving chlorine gases behind. High concentrations of reactive chlorine oxide radicals are rapidly produced by heterogeneous reactions if the initial concentration of HCl exceeds a critical value, 0.5 times the concentration of NOx before onset of condensation. Production of unreactive ClNO3 and HOCl is favored if HCl levels are lower than this value. The onset of antarctic ozone depletion in the late 1970s may in part reflect growth of HCl levels beyond this threshold. (Auth.)

Frese, W., **Is there a breakup of the Earth's ozone screen** [Zerreisst der Ozon-Schleier der Erde?], *MPG Spiegel,* Mar. 1987 No.1, p.1-4, In German.

For a number of years a hole regularly opens from Sep. through Nov. in the ozone layer over Antarctica. This hole expands year by year and may soon find its counterpart over the North Pole. In recent data there, stratospheric ozone diminished between Jan. and Mar. The chemical processes by which CFCs interact with natural atmospheric processes to deplete the ozone layer are discussed and compared with the observed ozone depletion over Antarctica in recent years.

Labitzke, K., **Lower stratosphere over the polar regions in winter and spring: relation between meteorological parameters and total ozone,** *Annales geophysicae,* June 1987 5(3), p.95-102, 20 refs.

To enlarge the discussion on the ozone hole from a meteorological point of view, this paper summarizes climatological features of the lower stratosphere over both polar regions and points to differences. It is suggested that until 1981 most of the observed changes in total ozone over Antarctica can be explained by the different timing of the Final Warmings. Observations for the Arctic during early winter show that the polar vortex became colder and the polar night jet stronger after the volcanic eruptions of Agung, St. Helens and El Chichón. It is suggested that the increased stratospheric aerosol caused this cooling under polar night conditions, and that the same effect led to delayed Final Warmings over Antarctica. Then, a strong and relatively undisturbed polar vortex was available during the whole Oct. and complex chemistry (possibly involving also the increased aerosol) could destroy part of the ozone within the vortex. Therefore, the combined effects of chemistry and dynamics are made responsible for the ozone hole. (Auth. mod.)

Wendler, G., Ishikawa, N., Kodama, Y., **Heat balance of the icy slope of Adelie Land, eastern Antarctica,** *Journal of applied meteorology,* Jan. 1988 27(1), p.52-65, 30 refs.

A complete heat budget investigation was carried out in summer at a site in Adelie Land, some 100 km from the edge of the antarctic ice sheet. For an average day, the all wave radiation budget, based on the fluxes toward the surface being positive, was positive for about 11 h, which is a short time considering that the sun was above the horizon between 22 and 24 h a day during the observational period. It is a result of the high albedo, which, on average, was about 83%. Furthermore, with increasing cloudiness, a more positive radiation budget was found, which is in contrast to most studies at lower latitudes. The heat flux in and out of the snow cover was small, and showed a typical sinusoidal diurnal variation. The mean daily values of snow heat flux were negative, as the snow cover was warmed during the observational period. The latent heat flux was negative, on the average, as sublimation took place for most of the time. Deposition was observed only on a few nights. The sensible heat flux was negative around noon, but positive for most of the day, which means that the air above the surface was cooled, an inversion developed, and as the surface is inclined, gravitational flow (katabatic wind) started to occur. While the all-wave radiation balance had its minimum around midnight, the minimum temperature was observed some 3 h later, and the maximum wind speed occurred about 2 additional hours later. (Auth.)

Kiehl, J.T., Boville, B.A., Briegleb, B.P., **Response of a general circulation model to a prescribed antarctic ozone hole,** *Nature,* Apr. 7, 1988 332(6164), p.501-504, 15 refs.

Model simulation of the 'ozone hole' observed in austral springtime indicates that the ozone depletion leads to a temperature decrease in the lower antarctic stratosphere of about 5 K in mid-Oct. The temporal evolution of the thermal balance in the control shows that weak upward motion occurs by mid-Sep. and the temperature tendency is dominated by the net radiative heating through late Sep. to Nov. When the ozone hole is imposed, downward motion persists through Sep. to mid-Oct. and the final warming in Nov. is postponed. (Auth.)

Chelton, D.B., **Time dependent wind fields. Final report, Jan. 27, 1986,** *U. S. National Aeronautics and Space Administration. Contractor report,* Jan. 1986 NASA-CR-179959, 63p., N87-13839, 10 refs. Four appendixes include reprints of articles written by the author and P.J. McCabe and L.L. Fu.

Two tasks were performed: determination of the accuracy of Seasat scatterometer, altimeter, and scanning multichannel microwave radiometer measurements of wind speed; and application of Seasat altimeter measurements of sea level to study the spatial and temporal variability of geostrophic flow in the Antarctic Circumpolar Current. The results of the first task have identified systematic errors in wind speeds estimated by all three satellite sensors. However, in all cases the errors are correctable and corrected wind speeds agree between the three sensors to better than 1m/s in 96-day 2 deg latitude by 6 deg longitude averages. The second task has resulted in development of a new technique for using altimeter sea level measurements to study the temporal variability of large scale sea level variations. Application of the technique to the Antarctic Circumpolar Current yielded new information about the ocean circulation in this region of the ocean that is poorly sampled by conventional ship-based measurements. Breuer, G., **How does the ozone hole form** [Wie entsteht das Ozon-Loch], *Naturwissenschaftliche Rundschau,* Feb. 1988 41(2), p.62-64, In German.

In recent years there has been a dramatic reduction in ozone concentration over Antarctica during the spring (Sep/Oct). Al-

though the controlling processes are not yet completely explained, the participants in a recently held Dahlem conference on atmospheric modification were in unanimous agreement that the leading cause of this condition is the increasing loading of the atmosphere with chlorinated carbohydrates. Joint German-Swedish investigations are being undertaken to determine whether similar developments are occurring over the Arctic region.

Rosenfield, J.E., Schoeberl, M.R., Newman, P.A., **Antarctic springtime ozone depletion computed from temperature observation,** *Journal of geophysical research,* Apr. 20, 1988 93(D4), p.3833-3849, 35 refs.

An observationally based, mechanistic dynamical model is used to simulate the decline of total ozone during Sep. and Oct. for the years 1979 through 1986. Vertical velocities derived from observed stratospheric temperature changes and computed radiative heating rates are used to advect an ozone mixing ratio profile during the antarctic spring period. An early Aug. 1982 Showa balloonsonde ozone profile is used to initialize the computations. The model reasonably simulates the Sep. and Oct. changes in total ozone, considering the uncertainties in the observed data and the radiative heating. The simulated decline is found to be very sensitive to the choice of initial ozone profile and to small changes in the radiative heating. The results of this study suggest that the dynamical hypothesis of the antarctic ozone depletion is both quantitatively credible and consistent with the observed temperature changes. (Auth.)

I-37336

Rowland, S., **Can we close the ozone hole,** *Technology review,* Aug./Sep. 1987 90(6), p.50-58.

Concerns about stratospheric ozone, beginning with the general awareness, in the early 1970s, that the industrial release of chlorofluorocarbon (CFC) gases into the atmosphere could damage the Earth's ozone shield, are described. The chemical processes involved are discussed, and the long term consequences examined, including ozone's effect on radiation and the raising of Earth's temperature. Moves toward international regulations to effectively reduce CFC use, such as bans on aerosol propellants, are reviewed. An immediate worldwide freeze, with a 95% phaseout by the early 1990s, is recommended.

Gao, D., Kawaguchi, S., **Relationship between the increase of temperature and variation of ozone level over Antarctica and the Tibetan Plateau in spring,** *Advances in atmospheric sciences,* Nov. 1986 3(4), p.489-498, 7 refs.

On the basis of ozone and aerological sounding data at Showa Station during 1966-1979, and Lhasa Station during 1979-1983, the processes of temperature increase in spring over the Tibetan Plateau and Antarctica are compared. The relationship between the increase of air temperature and variation of total ozone and ozone partial pressure is analyzed. It is found that: the process of temperature increase over the Tibetan Plateau is quite different from that over Antarctica in spring (this is proof that the heating effects of their ground surface on the atmosphere are very different); sudden increase of total ozone is always associated with sudden warming in the stratosphere over Antarctica, but sudden decrease of total ozone is associated with sudden warming in the troposphere over the Tibetan Plateau in spring; and there is a positive correlation of about 0.85 between the temperature increase and variation of ozone partial pressure in the stratosphere over Antarctica in spring. Molina, L.T., Molina, M.J., **Production of ClO2 from the self-reaction of the ClO radical,** *Journal of physical chemistry,* Jan. 15, 1987 91(2), p.433-436, 21 refs.

The species Cl2O2 has been generated in a gaseous flow system at 220-240 K by reacting Cl atoms with one of 3 different ClO precursors: O3, Cl2O, or OClO. The infrared spectra of the reactive mixture indicate that at least two different dimers are produced: a predominant form with bands centered at 1225 and 1057/cm attributed to ClOOCl, and a second form with a band at 650/cm attributed to ClOClO. The UV spectrum of the predominant form shows a maximum absorption cross section of about 6.5 quintillionths sq cm/molecule around 270 nm, with a wing extending beyond 300 nm. The implications of these results for the chemistry of the stratosphere are discussed. The specific implication is that a cycle consisting of four chemical reactions could play a role in the annual antarctic ozone decline provided that the UV measurements are correct and that the primary ClO2 products are Cl + ClOO. (Auth. mod.)

Crowley, T.J., North, G.R., **Abrupt climate change and extinction events in Earth history,** *Science,* May 20, 1988 240(4855), p.996-1002, Numerous refs.

Slowly changing boundary conditions can sometimes cause discontinuous responses in climate models and result in relatively rapid transitions between different climate states. Such terrestrially induced abrupt climate transitions could have contributed to biotic crises in earth history. Ancillary events associated with transitions could disperse unstable climate behavior over a longer but still geologically brief interval and account for the stepwise nature of some extinction events. There is a growing body of theoretical and empirical support for the concept of abrupt climate change, and a comparison of paleoclimate data with the Phanerozoic extinction record indicates that climate and biotic transitions often coincide. However, more stratigraphic information is needed to precisely assess phase relations between the two types of transitions. The climate-life comparison also suggests that, if climate change is significantly contributing to biotic turnover, ecosystems may be more sensitive to forcing during the early stages of evolution from an ice-free to a glaciated state. The analysis suggests that a terrestrially induced climate instability is a viable mechanism for causing rapid environmental change and biotic turnover in earth history, but the relation is not so strong that other sources of variance can be excluded. A connection is made between

paleoclimates and biological extinctions as the Arctic, Antarctic, and Greenland sea ice and glaciations waxed and waned, sometimes over periods of only one or two centuries. (Auth. mod.)

Tolbert, M.A., Rossi, M.J., Golden, D.M., **Antarctic ozone depletion chemistry: reactions of N2O5 with H2O and HCl on ice surfaces,** *Science,* May 20, 1988 240(4855), p.1018-1021, 23 refs.

The reactions of dinitrogen pentoxide (N2O5) with H2O and hydrochloric acid (HCl) were studied on ice surfaces in a Knudsen cell flow reactor. The N2O5 reacted on ice at 185 K to form condensed-phase nitric acid (HNO3). This reaction may provide a sink for odd nitrogen (NOx) during the polar winter, a requirement in nearly all models of antarctic ozone depletion. A lower limit to the sticking coefficient, *gamma,* for N2O5 on ice is 0.001. Moreover, N2O5 reacted on HCl-ice surfaces at 185 K, with *gamma* greater than 0.003. This reaction, which produced gaseous nitryl chloride (ClNO2) and condensed-phase HNO3, proceeded until all of the HCl within the ice was depleted. The ClNO2, which did not react or condense on ice at 185 K, can be readily photolyzed in the antarctic spring to form atomic chlorine for catalytic ozone destruction cycles. The other photolysis product, gaseous nitrogen dioxide (NO2), may be important in the partitioning of NOx between gaseous and condensed phases in the antarctic winter. (Auth.)

Brasseur, G., Hitchman, M.H., **Stratospheric response to trace gas perturbations: changes in ozone and temperature distributions,** *Science,* Apr. 29, 1988 240(4852), p.634-637, 21 refs.

The stratospheric concentration of trace gases released in the atmosphere as a result of human activities is increasing at a rate of 5 to 8 percent per year in the case of the chlorofluorocarbons (CFCs), 1 percent per year in the case of methane (CH4), and 0.25 percent per year in the case of nitrous oxide (N2O). The amount of carbon dioxide (CO2) is expected to double before the end of the 21st century. The abundance of active chlorine (2 parts per billion by volume in the early 1980s) is expected to reach 6 to 7 parts per billion by volume by 2050. The impact of these increases on stratospheric temperature and ozone was investigated with a two-dimensional numerical model. The model includes interactive radiation, wave and mean flow dynamics, and 40 trace species. An increase in CFCs caused ozone depletion in the model, with the largest losses near the stratopause and, in the vertical mean, at high latitudes. Increased CO2 caused ozone amounts to increase through cooling, with the largest increases again near 45 km and at high latitudes. This CO2-induced poleward increase reduced the CFC-induced poleward decrease. Poleward and downward ozone transport played a major role in determining the latitudinal variation in column ozone changes. The figures included show stratospheric temperature distributions and zonal air motions to 70 km altitude, on a global range extending from 90N to 90S. (Auth. mod.)

Yamanaka, M.D., Yamazaki, K., Kanzawa, H., **Studies of middle atmosphere dynamics under the Polar Patrol Balloon (PPB) project: present status and future plans,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.65-74, 29 refs.

Studies of middle atmospheric dynamics under the PPB project have two aspects. On one hand, they are necessary to predict feasibility of PPB flight. Recent studies on global-scale disturbances (planetary waves) over the antarctic stratosphere suggest that the mid-summer (Dec.-Jan.) flight at 30-40 km altitudes has a trajectory with meridional fluctuations around the initial latitude. The mid-winter (June-Aug.) flight in the antarctic stratosphere may be much more circumpolar than that in the Arctic. The spring (Oct.-Nov.) and autumn (Feb.) flights are not adequate for circumpolar observations. (Auth. mod.)

Nomura, A., **Dynamics of the mesospheric sodium layer in Antarctica: lidar measurements at Syowa Station, 1985,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.75-83, 19 refs.

Lidar measurements of the mesospheric sodium layer were made on 42 nights from Apr. to Oct. in 1985 during the wintering period of JARE-26 at Showa Station. This work was carried out as a part of the Middle Atmosphere Program (MAP). There were no significant seasonal variations in sodium abundance. Especially, the enhancement of abundance in winter was not observed. These results differ from those obtained at midlatitudes in the Northern Hemisphere. However, it is interesting that the sodium abundance oscil-

lated with a period of about 36 days. As for the nocturnal variations of the sodium layer, the semidiurnal oscillation in the abundance was not detectable, but the wavelike structure due to gravity wave activity was frequently observed in the sodium vertical profile. Moreover, it was found that the sodium layer was perturbed during an auroral breakup event. (Auth.)

Kawamoto, H., Ogawa, T., **Negative ions in the lower atmosphere,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.88-98, 26 refs.

The chemical compositions of negative ions in the lower atmosphere (0-30 km altitude) at middle latitudes were investigated with two models, one for the lower stratosphere (15-30 km) and the other for the troposphere (0-15 km). The calculated result shows that the predominant ion species are NO3 neg HNO3H2O in the height range of 0-10 km and NO3 neg (HNO3)2 in 10-30 km, and other main negative species have NO3 neg or HSO4 neg cores. In general, the calculated result agrees with the observed one. A possible role of the ions and aerosols generated by the ion-nucleation mechanism is suggested for the antarctic springtime 'ozone hole' phenomenon. (Auth.)

Salawitch, R.J., Wofsy, S.C., McElroy, M.B., **Chemistry of OClO in the antarctic stratosphere: implications for bromine,** *Planetary and space science,* Feb. 1988 36(2), p.213-224, Refs. p.222-223.

Observations of OClO over Antarctica in the spring of 1986 are used to place constraints on the abundance of stratospheric bromine. Production of OClO is thought to be due mainly to reaction of ClO with BrO. The observed diurnal variation is consistent with this source only if a fraction of the overall ClO+BrO reaction, between 3.5% and 14%, is assumed to result in production of BrCl. Otherwise the observed diurnal variation of OClO implies an additional source in twilight. The analysis suggests a concentration of stratospheric bromine of 16 pptv, consistent with independent measurements of gaseous bromine which, despite major uncertainty, indicate a range from about 5 to 20 pptv. (Auth.)

McElroy, M.B., Salawitch, R.J., Wofsy, S.C., **Chemistry of the antarctic stratosphere,** *Planetary and space science,* Jan. 1988 36(1), p.73-87, Refs. p.86-87.

Interferometric measurements of HCl, ClNO3, HNO3, NO2 and NO obtained over the Antarctic in 1986 are used to constrain models for the chemistry of the atmosphere in the region of the Ozone Hole. It is shown that the abundance of stratospheric HCl was exceptionally low in early Sep. over McMurdo Station and that it recovered below 20 km at a rate consistent with the gas phase reaction of Cl with CH4. The low abundance of HCl is attributed to incorporation of HCl in polar stratospheric clouds (PSCs), and subsequent reaction of HCl with ClNO3 providing a source of chlorine radicals. There is evidence for net loss of HNO3 from the stratosphere. This is attributed to condensation of HNO3 in PSCs followed by precipitation. The abundance of odd nitrogen is suppressed also at high altitudes in the vortex, reflecting in part, it is suggested, the influence of of the reaction of N with NO in the cold summer mesosphere. (Auth. mod.)

Rowland, S., **Chlorine chemistry in the antarctic stratosphere,** North American Conference on Preparing for Climate Change, 1st: a Cooperative Approach, Washington, D.C., Oct. 27-29, 1987. Proceedings, Rockville, MD, Government Institutes, Inc., Apr. 1988, p.55-76, 18 refs.

Results from research carried out over Antarctica, which led to the conclusion that the increase of anthropogenic chlorine is an integral factor in the loss of ozone, are briefly reviewed and followed by a detailed description of the following: the chlorine chemistry in the troposphere and stratosphere; and stratospheric chemistry of chlorofluorocarbons; and the antarctic meteorology, with emphasis on the polar vortex and polar stratospheric clouds and the resulting stratospheric ozone depletion. The applicability of the understanding of the special characteristics of antarctic chemistry and meteorology to the Arctic, and to the stratosphere of the temperate and tropical zones, is considered.

I-37504

Kerr, R.A., **Evidence of Arctic ozone destruction,** *Science,* May 27, 1988 240(4856), p.1144-1145.

Reported here are discussions of a Polar Ozone Workshop held in Colorado in May 1988. A team of NOAA atmospheric scientists compared spectrographs of the antarctic atmosphere with some made of the arctic atmosphere at Thule, Greenland. A number of similarities between the two regions are pointed out. A Harvard group also reported elevated levels of chlorine and ozone. The two groups are in disagreement as to the cause of the phenomenon over the Arctic: NOAA opts for heterogeneous chemistry while the Harvard group contemplates the effect of the polar vortex.

Singh, O.N., **Hole in the ozone layer—a much discussed phenomenon of this decade,** *Naturwissenschaften,* Apr. 1988 75(4), p.191-193, 28 refs.

The ozone layer in the middle atmosphere, responsible for the very existence of the stratosphere, has been observed to shrink drastically every austral spring over Antarctica. This phenomenon, popularly known as the "hole in the ozone layer," is considered to occur due to the catalytic destruction of ozone by ClOx and BrOx radicals, produced from the decomposition of mostly manmade halocarbons. If the present trend of the deepening of the hole with time persists, effects on global circulation and world climate may be expected for the near future. (Auth.)

Rayneaud, D., **Climatic and CH4 cycle implications of glacial-interglacial CH4 change in the Vostok ice core,** *Nature,* June 16, 1988 333(6174), p.655-657, 21 refs.

The atmospheric CH4 increase from about 0.7 to 1.68 p.p.m.v. over about the past 300 years, which has been documented from analysis of air trapped in ice cores and from tropospheric measurements, is attributed to anthropogenic modifications of the CH4 cycle. The concern about this increase is due to the radiatively and chemically active nature of CH4. Strong evidence is presented from analysis of the Vostok ice core, that CH4 concentrations increased from 0.34 to 0.62 p.p.m.v. between the end of the penultimate ice age and the following interglacial, about 160-120 kyr BP. This CH4 change may be explained by considering the effect of the climatic change on the CH4 cycle. Its contribution (including chemical feedback) to the global climatic warming is estimated to be about 25% of that due to CO2. (Auth.)

Hodell, D.A., Elmstrom, K.M., Kennett, J.P., **Latest Miocene benthic delta O-18 changes, global ice volume, sea level and the 'Messinian salinity crisis',** *Nature,* Apr. 3-9, 1986 320(6061), p.411-414, 35 refs.

Oxygen isotope evidence indicates high but variable delta O-18 values in benthic foraminiferal calcite during the latest Miocene and earliest Pliocene. These high values may represent increases in global ice volume and associated sea-level fall. The delta O-18 record resembles glacial/interglacial cycles, but with only one-third the amplitude of the late Pleistocene signal. This variability may reflect instability in the Antarctic ice sheet, and palaeomagnetic correlation points to an isotopic event coinciding with the isolation and desiccation of the Mediterranean basin during the latest Messinian. (Auth.)

J-34685
Corliss, B.H., Martinson, D.G., Keffer, T., **Late Quaternary deep-ocean circulation,** *Geological Society of America. Bulletin,* Sep. 1986 97(9), p.1106-1121, Refs. p.1120-1121.

A review of paleoceanographic studies dealing with late Quaternary deep-water circulation in the oceans is presented. These studies, which are based on the analysis of deep-sea benthic foraminiferal faunal and geochemical data and sedimentological data, are discussed in light of physical oceanographic conditions in the modern ocean. A re-evaluation of benthic foraminiferal data from North Atlantic and southern ocean piston cores is included and it is suggested that the dominance of *Uvigerina* during glacial intervals reflects increased amounts of organic carbon at the sea floor compared to modern values. The record of Antarctic Bottom Water (AABW) circulation does not show a simple relationship with paleoclimatic oscillations, indicating that changes in oceanographic conditions in the southern ocean had little effect on AABW formation. The AABW record contrasts with the glacial-interglacial cycles of North Atlantic Deep Water (NADW), suggesting no direct link between AABW and NADW circulation. A variety of data suggests that changes in Pacific Deep Water circulation occurred as a result of glacial production of North Pacific deep water or from an increased flux of southern ocean water. Stein, M., **Variability of water masses and currents off the Antarctic Peninsula during SIBEX,** *Archiv für Fischereiwissenschaft,* Apr. 1986 37(Beiheft 1), p.25-50, 12 refs.

Observations on stratification and distribution of water masses in the Weddell-Scotia Confluence area, in the Bransfield Strait and west of the Antarctic Peninsula were performed from RV *Polarstern* in austral spring 1983 and 1984, and by FRV *Walther Herwig* in austral autumn 1985. CTD-profiles of temperature, salinity and sound velocity were carried out along a fixed grid of stations. The measurements reveal the seasonal variation of the main water mass boundary of the area. Based on horizontal distributions of salinity with depth it is shown that the haline signal of the Confluence is maintained down to 2500 m depth. The results obtained from the Bransfield Strait indicate low variance of the thermohaline field in the Bransfield Basins. Geostrophic computations performed along the deep station grid of the Elephant Island Box, in combination with a water mass analysis elucidate the nature of a sub-Warm Deep Water cold water injection. (Auth.)

Liebezeit, G., **Residual amino acid fluxes in the upper water column of the Bransfield Strait,** *Oceanologica acta,* Jan. 1985 8(1), p.59-65, 28 refs.

Fluxes of residual amino acids were determined on samples from two drifting sediment traps deployed at 100 m water depth in the Bransfield Strait in Dec. 1980. Differences in the absolute fluxes were related to the sources of sedimenting particulate matter. The relative contributions of amino acids to the total flux and the molar composition were similar for both traps. Comparison with published particulate amino acid fluxes indicates that a distinction must be made between high and low production environments. In the former case, 90% of the primary amino acid production is degraded within the upper 100 m of the water column, whereas in the latter case this zone is extended to approximately 1,000 m. (Auth.)

Ciesielski, P.F., Grinstead, G.P., **Pliocene variations in the position of the Antarctic Convergence in the southwest Atlantic,** *Paleoceanography,* June 1986 1(2), p.197-232, Refs. p.228-232.

Middle to late Pliocene (4.1-1.9 Ma) variations in the positions of surface water masses and migrations of the Polar Front in the southwest Atlantic are inferred from a factor analysis of radiolarian assemblages from DSDP site 514. Faunal results suggest that surface water masses underwent progressive cooling as the Polar Front Zone (PFZ) advanced northward during the latest Gilbert to late Gauss chron. This movement northward of cooler surface waters is inferred to be related to the initial growth of sea ice and ice shelves throughout regions of West Antarctica which were deglaciated or unglaciated during the prior warming interval of the Gilbert chron. It is suggested that the permanent change from subantarctic to antarctic surface water mass dominance was linked indirectly to the initial growth of Northern Hemisphere ice and a reduction of sea level. Ivanov, IU.A., Novitskiĭ, A.G., **On intensification of a frontal eddy embedded in a mean flow with a temperature gradient,** *Akademiia nauk SSSR. Izvestiya. Atmospheric and oceanic physics,* 1985 (Pub. June 1986) 21(11), p.924-926, Translated from its Izvestiia. Fizika atmosfery i okeana. 7 refs.

The evolution of a frontal cyclone in the Pacific sector of the Antarctic was investigated during the 30th cruise of the research ship *Dmitri Mendeleev.* Three hydrological surveys made it possible to determine the successive positions of a cold ring and to describe the variation of its thermohaline structure. Analysis of measurements of temperature, salinity, oxygen and other characteristics showed that the cyclonic frontal eddy formed in the vicinity of 60 S as a result of separation of the meander from the southern jet of the Antarctic Circumpolar Current. The frontal cyclone moved northeastward. The intensification of the eddy was caused by a coincidence of horizontal gradients of energy flux with the direction of eddy motion (the mean temperature and salinity gradients coincide with the direction of transfer).

Kozlov, V.F., Sokolovskiĭ, M.A., **Meander of a barotropic zonal current crossing a bottom ridge (Periodic regime),** *Oceanology,* 1981 21(6), p.684-687, Translated from Okeanologiia. 14 refs.

DLC GC1.03913

The interaction of a fluctuating barotropic zonal flow with an infinite bottom ridge is examined in the quasi-geostrophic approximation on the beta plane. The solution of the equation for pressure perturbation is constructed by direct asymptotic expansion with respect to the small parameter, proportional to the amplitude of fluctuations of the principal flow. The first approximation of Green's function for easterly and westerly flows is analyzed. The feasibility of employing this model for explaining features in the time variability of the Antarctic Circumpolar Current is discussed. (Auth.)

Bagriantsev, N.V., Guretskiĭ, V.V., **Heat transfer in the antarctic zone of the southern ocean,** *Soviet meteorology and hydrology,* 1986 No.1, p.50-56, For Russian original see 15J-33807. 16 refs.

The mechanism of oceanic heat transfer in the Antarctic is discussed; available estimates of heat transfer are analyzed. Heat transfer by average currents in the region of the Weddell Gyre is calculated and found to be formally indistinguishable from zero. It is presumed that heat transfer into the region of the gyre is accomplished by synoptic vortices and possibly by narrow intense currents found outside the limits of resolution of the calculation methods used. Cherniakova, A.M., Borodkin, S.O., **Hydrochemical indicators of frontal cyclonic eddy of the Antarctic Circumpolar Current,** *Oceanology,* 1985 (Pub. April 1986) 25(5), p.574-577, Translated from Okeanologiia. 3 refs.

The synoptic variability of the hydrochemical characteristics in the vicinity of the Antarctic Circumpolar Current (ACC) south of New Zealand is examined. The observations were carried out under the "Antarctic Ocean" program during Dec. 1982-Feb. 1983. It is shown that the investigated frontal cyclonic eddy formed by separation of a meander from the southern branch of the ACC at about 60S, which then moved northeast, transporting an antarctic water mass within its core. (Auth.)

Pedley, M., Paren, J.G., Potter, J.R., **Tidal spectrum underneath antarctic ice shelves,** *Journal of geophysical research,* Nov. 15, 1986 91(C11), p.13,001-13,009, 19 refs.

A year-long tidal record has been obtained from beneath the George Vl Ice Shelf. An unusual feature of the record is a significant response in tidal species 3 to 7. These harmonics are practically absent from records further north on the west coast of the Antarctic Peninsula but are present in all tidal height records from George VI Sound. A strong ter-diurnal signal also exists in the tidal currents under the ice shelf. Nonlinearity also occurs in the tidal motion of the Ronne and Ekström Ice Shelves but has not been reported from the Ross Ice Shelf. The tidal dynamics of several antarctic ice shelves have therefore been modified by a region of strong nonlinear response to tidal forcing. An anelastic component in the deformation of the ice at the grounding line is tentatively proposed as the mechanism responsible. The positioning of recording pressure sensors in pairs on the seafloor and at the ice shelf base will allow this hypothesis to be tested and also provide a value for the power dissipated by tidally induced flexure at the grounding line. Ventajas, L., **Distribution and concentration of polynucleate hydrocarbons in the Weddell Sea** [Distribución de la concentración de hidrocarburos polinucleados a lo largo del mar de Weddell], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1986 No.320, 13p., In Spanish with English, German and French summaries. 4 refs.

Concentrations of polynucleate hydrocarbons in surface and depth samples, along the track of icebreaker A.R.A. *Alte. Irizar* in the Weddell Sea, are reported. The samples were obtained at the following depths: at the surface, and at 10, 25, 50, 75, 100, 150 and 200 m. The result of the analyses and a comparative study show that the distribution of the contamination values is not aleatory but follows a sequence. It is also observed that the form of the concentration section curves is similar among the South Weddell Sea stations, while in the Central Weddell Sea it varies. In the two northern stations near the Antarctic Peninsula, high values are found. It is concluded that these could be zones with ocean bottom porosity from which hydrocarbons could arise. (Auth. mod.)

Toole, J.M., **Problems of interbasin exchanges and marginal-sea overflows,** *American Meteorological Society. Bulletin,* Feb. 1987 68(2), p.136-140, 1 ref.

A workshop was convened 2-4 Apr. 1986, at the Woods Hole Oceanographic Institution to discuss WOCE plans for addressing the problems of interbasin exchange and marginal-sea outflow. Attendees were asked to address whether the mix of physical, chemical, and numerical measurements discussed previously was suitable on a global basis for studying the exchange and outflow problems. Reflecting the interests of those in attendance, the workshop focused primarily on the Atlantic sector. Presentations were made in three general categories: interbasin exchanges, marginal-sea overflows, and technologies thought valuable to the success of WOCE. A summary of the meeting proceedings and recommendations is given here; the full proceedings will appear as part of United States WOCE Planning Report No.5 A portion of the summary is given over to the southern ocean circulation and water masses around Antarctica, particularly Antarctic Bottom Water. (Auth. mod.)

Scripps Institution of Oceanography, **Physical, chemical and *in-situ* CTD (conductivity/temperature/depth) data from the Ajax Expedition in the South Atlantic Ocean,** La Jolla, 1985, 275p., ADA-166 146, 11 refs.

This data report presents hydrographic and CTD data collected aboard the RV *Knorr* on Ajax Expedition Leg 1, Abidjan, Ivory Coast to Cape Town, South Africa, and on Leg II, Cape Town to Punta Arenas, Chile. The expedition objectives were to provide data on the general circulation of the South Atlantic, Weddell Gyre and the Scotia Sea. A line of hydrographic stations, with sampling from the surface to the bottom on most stations, was occupied along the Greenwich meridian from the coast of Africa at 5 N to the antarctic ice edge at 69 S, and from there across the Scotia Ridge and through the Scotia Sea. In addition to the hydrographic measurements of temperature, salinity, oxygen and nutrients given in this report, water samples were also collected for analyses of other tracers such as freons 11 and 12, tritium and helium-3.

Seidov, D.G., Enikeev, V.Kh., **Modelling of ocean circulation and paleocirculation** [Modelirovanie tsirkuliatsii i paleotsirkuliatsii okeana], Moscow, Nauka, 1986, 95p., In Russian. 112 refs.

The book deals with oceans of the Southern Hemisphere. The first of 3 chapters reviews meteorological features of the Southern Hemisphere and the hydrology and currents of its oceans. The second ch. deals with the numerical modelling of ocean climate, and gives a short analysis of some diagnostic and prognostic numerical experiments on estimated large-scale currents. A numerical model of global water circulation is described in detail in ch. 3, with computation of contemporary currents and reconstruction of their geological history. Presented are also results of studies on sample models of the Southern Hemisphere oceans, and an analysis of contemporary and paleo-circulation, based on hydrological findings and paleo-reconstruction.

Venkatesan, M.I., Ruth, E., Kaplan, I.R., **Coprostanols in antarctic marine sediments: a biomarker for marine mammals and not human pollution,** *Marine pollution bulletin,* Dec. 1986 17(12), p.554-557, 21 refs.

The first analysis of sterols in antarctic marine sediment cores (Bransfield Strait and McMurdo Sound) is reported here. The isolated sterols in the sediments from Bransfield Strait are comprised mainly of dinosterol, coprostanol and epicoprostanol and trace amounts of cholesterol. The sediment cores of McMurdo Sound also contain small quantities of coprostanols in addition to large amounts of marine sterols. Dinosterol is a known dinoflagellate chemical marker, whereas coprostanols are currently being used as tracers for sewage contamination. However, sterol composition in antarctic sediments is expected to be atypical of sewage input and probably different from those of temperate and tropical zones. The coprostanols must therefore arise from the feces of marine mammals, most probably whales which use the region for feeding and spawning. Based on the results of this study, caution should be exercised in the use of coprostanol to estimate the amount of sewage-derived organic matter transported away from impacted coastal areas. (Auth.)

Harada, K., Tsunogai, S., **Fluxes of Th-234, Po-210 and Pb-210 determined by sediment trap experiments in pelagic oceans,** *Oceanographical Society of Japan. Journal,* June 1986 42(3), p.192-200, Refs. p.199-200.

Sediment trap experiments were carried out in the eastern Pacific Ocean and the Antarctic Ocean, which have very different biological productivities. The natural radionuclides, Th-234, Po-210 and Pb-210 were used as tracers of reactive metals. Larger particulate fluxes of these radionuclides were found in the seas where total mass fluxes were larger, although the concentrations of these radionuclides in the settling particles were somewhat smaller. The concentrations of Th-234 in the settling particles varied widely and irregularly with depth, whereas the concentrations of Po-210 and Pb-210 in the settling particles steadily increased with increasing water depth. These results suggest that, when the particles sink through the water column, these radionuclides are being absorbed by settling particles in the order Th-234 > Po210 > Pb-210, and that there must be a horizontal flow carrying these reactive metals from the oligotrophic ocean to the biologically productive ocean where the metals are removed by settling particles even in deep water. Fontugne, M., comp, Fiala, M., comp, **MD38/Apsara 2—Antiprod 3 on board the *Marion Dufresne* Jan. 16-Feb. 22, 1984** [MD38/Apsara II—Antiprod III à bord du *Marion Dufresne* 16 janvier-22 février 1984], *Terres Australes et Antarctiques Françaises. Mission de Recherche. Rapports des campagnes à la mer,* Feb. 1987 No.84-01, 345p., In French. Refs. passim. For individual papers see B-35225 through B-35230, E-35231, J-35221 through J-35224, and L-35232.

This volume is a collection of individual reports of research carried out in the Indian Ocean on board the *Marion Dufresne* in the austral summer of 1984. The introductory paper outlines the objectives of the 2 programs, Apsara 2 and Antiprod 3, shows schedules and team composition, and offers tables with meteorological, hydrological and biological data obtained during the cruise. The next 9 papers deal with the physical and chemical characteristics of the water masses, analysis of nutrient concentrations of surface waters, primary productivity measurements, studies of phytoplankton communities, and seabird distribution between the subantarctic islands and the antarctic continent. The last 2 papers offer results of geological, biostratigraphic and geophysical studies carried out on cores obtained in the region investigated.

Tréguer, P., **Physical and chemical properties of the Indian Ocean water masses south of the polar front** [Caractéristiques physiques et chimiques des masses d'eaux du secteur Indien de l'Océan Austral au sud du front polaire (Mer d'Amery) (Campagne Apsara II—Antiprod III, 1984)], *Terres Australes et Antarctiques Françaises. Mission de Recherche. Rapports des campagnes à la mer,* Feb. 1987 No.84-01, p.54-74, 15 refs., In French with English summary.

Physical and chemical characteristics of water masses are determined during Apsara 2 and Antiprod 3 (1984). Compared with previous data (1977, 1980), a constancy of the north Indian component of the Warm Deep Water (WDW), and a relatively large variability of the north Atlantic WDW component, is demonstrated. Dissolved Organic Nitrogen (DON) shows minimum concentrations in WDW. Urea is only 2 to 4% of DON. By means of physical and chemical characteristics deep (WDW) and bottom waters (AABW) are identified: the north Indian component of WDW reaches 66 S; a penetration of South Indian Antarctic Bottom Water in the Weddell-Enderby is demonstrated. The input of AADW from Prydz Bay is undetectable. In superficial water masses, a classical decreasing ratio silicate/nitrate is observed going from the Antarctic Divergence to the Polar Front. Maximum values of ammonium occur near the continent. (Auth.)

Appriou, P., Bordin, G., Tréguer, P., Le Jehan, S., **Copper, manganese and cadmium in the antarctic sector of the Indian Ocean** [Cuivre, manganèse et cadmium dans le secteur Indien de l'Océan Antarcticque (Campagne Apsara II—Antiprod III, 1984)], *Terres Australes et Antarctiques Françaises. Mission de Recherche. Rapports des campagnes à la mer,* Feb. 1987 No.84-01, p.75-86, 3 refs., In French with English summary.

During the cruise Apsara 2 and Antiprod 3 the values for concentrations of copper, cadmium and manganese in the Indian sector of the antarctic ocean between latitudes 51 deg 00 S and 66 deg 58 S, have been determined. Profiles and surface distributions of these metals are similar to those obtained in other oceans, and show coastal influences by increased concentrations in surface waters. Relationships between metals and other parameters are examined.

Simon, V., Sarano, F., **Nutrient salt concentrations of surface water in the Indian Ocean** [Concentrations en sels nutritifs de l'eau de surface dans le secteur Indien de l'Océan Austral (Campagne Apsara II—Antiprod III, 1984)], *Terres Australes et Antarctiques Françaises. Mission de Recherche. Rapports des campagnes à la mer,* Feb. 1987 No.84-01, p.87-103, 9 refs., In French with English summary.

A continuous analysis of the nutrient concentrations of surface water in the Indian sector of the southern ocean, carried out along several transects between 40 S and 67 S (Apsara 2 and Antiprod 3 cruise, 1984), shows a wide small-scale variability and, in early summer, close connection between nutrients and hydrological structure. In this area, deep circulation is strongly disturbed by the presence of the Crozet and Kerguelen-Heard Plateaux and, as a result, hydrological surface structure accurately reflects bottom features. The most remarkable result shown by continuous analysis is that nutrients evolve differently depending on the zone considered. In the convergence area, only nitrate concentrations sharply increase at the Subtropical convergence, whereas silicate concentrations do not increase till the Antarctic Convergence is reached. In the antarctic zone, a marked relationship between the two nutrients was observed. In late summer, effects of biological activity are added to those of physical processes, resulting in a greater decrease of silicate than nitrate concentrations in Surface Antarctic Water. (Auth.)

Lutjeharms, J.R.E., McQuaid, L.H., **Changes in the structure of thermal ocean fronts south of Africa over a three-month period,** *South African journal of science,* Sep. 1986 82(9), p.470-476, In English with Afrikaans summary. 32 refs.

The results of measurements on the thermal structure of the upper ocean layers between South Africa and Antarctica are presented. The location of five frontal systems in the area and their temporal evolution are shown, based on four cruise lines carried out by two vessels over a period of two months during the summer of 1979-80. The growth of step-like frontal morphologies with the onset of summer is confirmed. Results suggest that the changeover in the thermal structure from a winter to a fully developed summer regime may occur over a relatively short period. (Auth.)

Kellogg, T.B., Kellogg, D.E., **Glacial-interglacial changes in Antarctic Bottom Water,** *South African journal of science,* Sep. 1986 82(9), Palaeoclimate and Evolution III, p.501-503, 43 refs.

A number of papers presented at the Workshop on Neogene Glacial History of the Antarctic Cryosphere deal directly or indirectly with the formation and flow of deep and bottom water masses derived from Antarctic continental shelves. In all cases, it was assumed that Antarctic Bottom Water (AABW) forms on Antarctic continental shelves, presumably by the well-known processes of salt-rejection during sea-ice formation with subsequent density increase caused by the cabbeling instability: classic AABW. This note reviews the recent literature on processes of deep and bottom water formation and describes some ramifications for palaeo-oceanographic and palaeoclimatic reconstructions. (Auth.)

Mabin, M.C.G., **Ross Sea section of the antarctic ice sheet at 18 000 yr B.P.: evidence from the Holocene sea-level changes along the Victoria Land coast,** *South African journal of science,* Sep. 1986 82(9), Palaeoclimate and Evolution III, p.506-508, 9 refs.

Three different approaches can be used to reconstruct Pleistocene ice sheets: glacial geology, glaciological theory, and glacial isostasy. In this paper preliminary results are reported of a survey of raised beaches in Victoria Land, and evidence is discussed for relative sea-level change and glacial isostasy of this part of the antarctic ice sheets. Kelly J., R., Blanco G., J.L., **Hydrography of Bransfield Strait during SIBEX-2, Chile, summer 1985** [Hidrografía del estrecho Bransfield durante el verano austral 1985 (SIBEX-Fase II, Chile)], *Santiago de Chile. Instituto Antártico Chileno. Serie científica,* 1986 No.35, p.7-30, 16 refs., In Spanish with English summary.

The SIBEX-2 cruise was carried out on the *M/N Capitan Luis Alcazar,* between Jan. 24 and Feb. 12, 1985, in waters of the Bransfield Strait and adjacent zones. Temperature, salinity and dissolved oxygen data were obtained in 31 oceanographic stations down to a maximum depth of 700 m. With this information an analysis was made of the properties distribution, water masses, geopotential difference and stability of the upper layer. The results presented similar characteristics to those obtained during SIBEX-1, although temperature and salinity were slightly higher. Some characteristics which could be considered permanent during this season were identified. These are the saline front located south of Trinity I., the meander present with more or less intensity south of Deception I., the presence of the Weddell-Scotia Confluence south of Piloto Pardo Is. and the composition of the water bodies in the Bransfield Strait. (Auth.)

Silva S., N., **Chemical oceanography of the Bransfield Strait waters: micronutrient contents (SIBEX-2, Chile)** [Oceanografía química de las aguas del estrecho Bransfield: Compuestos micronutrientes (SIBEX-Fase II, Chile)], *Santiago de Chile. Instituto Antártico Chileno. Serie científica,* 1986 No.35, p.31-61, 18 refs., In Spanish with English summary.

Water samples, collected in the upper 700 m of the Bransfield Strait and vicinity in the austral summer of 1985, were analyzed for their micronutrient content (phosphate, silicate and nitrate). Results, compared with concentrations found in previous years, were found to be statistically different from the summer of 1981 but similar to those observed in 1984. Two water masses are identified in this area: Bellingshausen Antarctic Surface Water and Weddell Sea Surface water; and 4 water bodies: Bransfield Strait Surface Water, Gerlache Strait Surface Water, Antarctic Peninsula Continental Shelf Surface Water and Bransfield Strait Deep Water. Micronutrient contents for each of these bodies of water are given in relation to each other. Six different temperature-salinity (T-S) diagrams are identified. A zonation map was prepared to show where these structures were present. In relation to the temperature-micronutrient diagrams (T-Phosphate, T-Nitrate and T-Silicate), they were used as a complement to the T-S diagrams in the water mass structure characterization of the area. Rojas R., R., **Thermal structure and heat flux in the Bransfield Strait during SIBEX-2, 1985** [Estructura térmica y flujos de calor en el estrecho Bransfield durante SIBEX 1985 (SIBEX-Fase II-Chile)], *Santiago de Chile. Instituto Antártico Chileno. Serie científica,* 1986 No.35, p.63-87, 14 refs., In Spanish with English summary.

A cruise named SIBEX-2 performing oceanographic observations in the Bransfield Strait between Jan. 20 and Feb. 15, 1985, and continuing the study of the thermal structure of the Bransfield Strait initiated during SIBEX-1 is described. A total of 57 XBT and salinity samples were obtained. Using the meteorological data of the area a heat flux budget was made. The temperature distribution pattern of SIBEX-1 is quite similar to that of SIBEX-2 though higher temperatures were found north of the strait during the last cruise. Except for the 50 m depth level, the temperatures at any other compared depth between the two cruises were statistically not different (99% confidence). From the surface temperature, salinity and density distributions, it was not possible to determine the formation of the meander between Deception and Bravante Is. nor the Weddell Scotia Confluence south of Elephant and Clarence islands. The cyclonic eddy located south of King George I. is suggested by the surface isopicnal distribution. Regarding the heat flux budget in the Bransfield Strait, an atmosphere to ocean transfer of 222 (cal/sq cm/day) was obtained which reasonably agrees with heat flux estimates for the same period for the southern ocean. A simple box model for the area states that the rate of heat flux to the waters of the strait between atmosphere and advective processes is 2:1. (Auth. mod.)

Lawver, L.A., Vedova, B.D., Von Herzen, R.P., **Heat-flow measurements in the Jane Basin, a back-arc basin, northern Weddell Sea,** *Antarctic journal of the United States,* 1985 20(5), p.87-88, 1 ref.

R/V Discovery, the British oceanographic research ship, undertook a cruise that explored the Antarctic Peninsula, the Weddell Sea, and the South Sandwich Trench regions of the southern oceans. Thirty-seven separate measurements were made of heat flow during five stations. Twenty-three of the penetrations were made using a 6-m barrel with seven outrigger thermistors spaced 65 to 90 cm apart. The remaining 14 penetrations were taken using 3.5-m probe. Two lower sections of the 6-m probe were lost in attempts to penetrate very hard sandy sediments. Stations in the Jane Basin, with the exception of the one penetration nearest the South Orkney block, all showed full penetration with virtually straight thermal gradients. The thermal gradients that had changes in slope, could generally be correlated with changes in the measured *in situ* thermal conductivity. Two hundred fifteen *in situ* thermal conductivities and 74 needle probe conductivities were measured in the Jane Basin area. In general, the *in situ* thermal conductivity agreed to within a few percent with the measured needle-probe thermal conductivity.

Dunbar, R.B., MacPherson, A.J., Wefer, G., **Water-column particulate flux and seafloor deposits in the Bransfield Strait and southern Ross Sea, Antarctica,** *Antarctic journal of the United States,* 1985 20(5), p.98-100, 15 refs.

A recent proliferation of sediment trap experiments and surface sediment collection allows development of models for sedimentation on the antarctic shelf. Shelf surface sediments have biogenic silica contents ranging up to 45 weight % and organic carbon contents ranging up to 2.3 weight %. Organic C to opal ratios are low due to more efficient oxidation of organic C relative to silica dissolution. Two potential "end-member" Antarctic depositional environments are examined in detail. In the southern Ross Sea, modern terrigenous input appears negligible, and biogenic particles sink as slowly settling aggregates of undigested opaline debris, resulting in sediments with high opal and low organic C contents. In the Bransfield Strait, zooplankton pellets rapidly transport freshly produced biogenic phases to the seafloor. Organic carbon preservation is enhanced, but dilution of both opal and organic C with an increased supply of terrigenous material occurs both in the water column and at the seafloor.

Leventer, A.R., Dunbar, R.B., **Suspended particulate matter in antarctic coastal waters,** *Antarctic journal of the United States,* 1985 20(5), p.100-103, 14 refs.

Suspended particulate matter was collected from McMurdo Sound, the Antarctic Peninsula region, and adjacent to the Ross Ice

Shelf. Concentrations of suspended material range between 50-3000 microg/l, two or more orders of magnitude lower than concentrations measured in glaciomarine environments subject to large influxes of sediment laden meltwater. Surface water particulate concentrations are influenced greatly by primary production within the photic zone. Low mid water concentrations observed in the Antarctic Peninsula (100-200 microg/l) may reflect efficient grazing, pelletization, and subsequent shorter particle residence times as compared to the Ross Sea and McMurdo Sound. Near bottom nepheloid layers are observed in several of the profiles from the Ross Sea and northwestern Weddell Sea.

Foster, T.D., Yutian, M., Eckert, E.G., **Physical oceanography during the Wilkes Land Expedition 1985,** *Antarctic journal of the United States,* 1985 20(5), p.104-105, 2 refs.

It was the purpose of the Expedition to investigate the possibility that deep water forms between 147 and 162 deg E. To that end hydrographic sections were made orthogonal to the general bathymetry from the open ocean up onto the continental shelf to delineate the temperature and salinity structure of the ocean through a complete vertical profile at each station. Preliminary results are indicated.

Michel, R.L., Keir, R.S., Schroeder, R.A., **Chemical oceanography during the 1985 Wilkes Land Expedition,** *Antarctic journal of the United States,* 1985 20(5), p.105-107, 12 refs.

Seven hydrographic sections were sampled for chemical content. Freons, acid balance, alkalinity, and nutrients were gathered in all sections. More extensive samplings were made in sections 3 and 7 where samples for tritium, helium-3, carbon-14, calcium, and stable isotopes were also collected. Preliminary data for the sections across the shelf break near Wilkes Land show high freon concentrations along the continental slope.

Hughes, P., Krissek, L.A., **Modern sediments of the Terra Nova Bay polynya, Ross Sea, Antarctica,** *Antarctic journal of the United States,* 1985 20(5), p.107-108, 6 refs.

The primary process that makes the area of the Terra Nova Bay polynya different from adjacent ice-covered areas is wind blown materials from exposed rocks on the shore. Katabatic winds blow steadily at 30k here, with much greater velocities during storms. The same winds blow icebergs quickly out to sea, accounting for the decreased deposition of glacially transported materials. Other sediment components are similar to those found in ice-covered areas.

Whitworth, T., III, **Atlantic long lines, leg II, Cape Town to Punta Arenas,** *Antarctic journal of the United States,* 1985 20(5), p.119-120, 3 refs.

The Atlantic long lines experiment was designed to provide a nearly synoptic section between North Africa and Antarctica along the Greenwich Meridian. The first part of the cruise track of Ajax II was from 45 S to the edge of the pack ice off Antarctica at 69.3 S. About 3,000 individual water samples were collected and analyzed for salinity, oxygen, silicate, nitrate, nitrite, and phosphate concentrations. The rest of leg II was devoted to several specialized studies in the Weddell and Scotia Seas. Analysis of the preliminary data reveals that the subantarctic and Polar Fronts are nearly as narrow in the open ocean along the Greenwich Meridian as they are in the restricted confines of Drake Passage. Evidence was found of an eastward extension of the Weddell-Scotia Confluence to 1 E, confirming an earlier observation. Tracer distributions indicate that Weddell Sea bottom water circulates cyclonically around the Weddell Gyre as a bottom boundary current. The section across the South Sandwich Trench shows that cold, fresh Weddell Sea deep water flows to the north along the western flank of the trench. On the eastern edge of the trench, the deep flow is to the south. North of Elephant Island, there is a narrow band of cold, fresh, highly oxygenated water between 300 and 1,000 m. The water characteristics imply a Weddell Sea origin, and the westward flow may be part of a circumpolar Polar Slope Current.

Ivchenko, V.O., Klepikov, A.V., **Quasigeostrophic model of circulation in the southern ocean with parameterization of synoptic eddies,** *Akademiia nauk SSSR. Doklady. Earth science sections,* Mar.-Apr. 1985 281(2), p.196-198, 15 refs. For Russian original see 15J-33957.

Forecast models of large-scale ocean circulation require correct parametrization of synoptic-scale perturbations. This parametrization is particularly important in the case of zonal currents, such as the Antarctic Circumpolar Current (West Wind Drift, ACC). Since the Sverdrup relation does not in general apply to zonal currents, divergence of the eddy (turbulent) flow of potential vorticity must be significant in the balance of the vertical component of the curl of the wind shear stress. A set of equations is derived confirming that the Sverdrup balance does not hold in the main zonal stream. (Auth.)

Nowlin, W.D., Jr., Klinck, J.M., **Physics of the Antarctic Circumpolar Current,** *Reviews of geophysics,* Aug. 1986 24(3), p.469-491, Refs. p.489-491.

A region of transition of surface water characteristics from subantarctic to antarctic and an associated eastward flowing Antarctic Circumpolar Current (ACC) have long been recognized to exist as a band around Antarctica. In this review the authors summarize the most important observational and theoretical findings of the past decade regarding the ACC, identify gaps in what is known and recommend studies to address these. The nature of the meridional zonation of the ACC is only now being revealed. The ACC seems to exist as multiple narrow jets imbedded in, or associated with, density fronts (the Subantarctic and Polar fronts) which appear to be circumpolar in extent. These fronts meander, and current rings form from them; lateral frontal shifts of as much as 100 km in 10 days have been observed. Literature is reviewed of the volume transport of the ACC, the meridional exchange of heat across it, the eddy variability, and other observations from ships, drifters and satellites. (Auth. mod.)

Whitehead, J.A., **On the ratio of mixing coefficients of heat and salt of Antarctic Bottom Water in the North Atlantic,** *Journal of geophysical research,* Mar. 15, 1987 92(C3), p.2981-2984, 2 refs.

Values of vertical eddy salt diffusivity and heat diffusivity for Antarctic Bottom Water were estimated by Whitehead and Worthington (1982) from both current meter results and geostrophic calculations. The ratios of the diffusivities have one impossible value of 0.858 for water colder than 1.1 C potential temperature for the geostrophic results. This could be evidence against the geostrophic results. However, a small interpolation error in their Tables 5 and 6 was uncovered. The corrected ratio is 1.01, which is possible, although very close to 1, and one other ratio is 0.98. Thus geostrophic calculations cannot be ruled out, but they lead to ratios very close to 1. (Auth.)

Sharma, G.S., Mathew, B., **Hydrography and circulation off the Antarctica in the Indian Ocean region,** *Indian Academy of Sciences. Proceedings. Earth and planetary sciences,* Mar. 1985 94(1), p.13-27, Refs. p.27.

The hydrography and circulation patterns off Antarctica in the Indian Ocean region are studied using vertical sections of temperature, salinity and oxyty along 20 E, 77 E and 90 E, and the dynamic topography of the sea surface with reference to 1000 db. Based on the oceanographic characteristics, the whole region under study can be divided into three zones, the extreme ends being characterized by the frontal structure. The dicothermal layer is conspicuous during summer south of 50 S. The surface flow around Antarctica is mainly zonal. The East Wind Drift, found as a narrow westward flow near Antarctica, is observed at a lower latitude in the eastern Indian Ocean where the land extends northward. Contrary to expectation, there is evidence of a westward flowing surface current at about 35 S, between 45 E and 65 E. (Auth.)

Gersonde, R., Wefer, G., **Sedimentation of biogenic siliceous particles in antarctic waters from the Atlantic sector,** *Marine micropaleontology,* Mar. 1987 11(4), p.311-332, 35 refs.

Sediment traps were deployed in the Drake Passage, Bransfield Strait and west of South Orkney Islands (Powell Basin) during Dec. 1980/Jan. 1981, Dec. 1983, and between Mar. and Dec. 1983, respectively. Most of the trapped material is biogenic opal except in the lower half of the water column in Bransfield Strait where large amounts of resuspended aluminosilicates and quartz grains were present. Frustules and skeletons of siliceous microorganisms (diatoms, silicoflagellates, radiolarians, chrysophycean cysts), fragments and moults of crustaceans and tests of foraminifera were found. Quantitatively diatoms are the dominant constituent of the trapped biogenic material. Alteration of diatom assemblages in the water column is due to mechanical breakdown by grazing zooplankton. It mainly affects large frustules in the uppermost part of the water column. Dissolution of frustules occurs mostly at the sediment/water interface and leads to the enrichment of strongly silicified valves. At the Bransfield Strait site a large part of biogenic opal was incorporated into fecal pellets of krill and copepods. The bulk of pellet content consists of fragmented diatom frustules. Most intact valves found in the sediments have settled through the water column by means other than fecal pellet transport. (Auth.)

Mead, G.A., Kennett, J.P., **Distribution of recent benthic foraminifera in the polar front region southwest Atlantic,** *Marine micropaleontology,* Mar. 1987 11(4), p.343-360, 50 refs.

Twenty-five core-top samples from the Maurice Ewing Bank (MEB) and Islas Orcadas Rise (IOR) were examined to determine the distribution of benthic foraminifera in the vicinity of the Polar Front in the southwest Atlantic Ocean. The Polar Front has a subsurface expression that affects the areal and depth distribution of benthic foraminifera in this region. Three faunal assemblages were identified by Q-mode factor analysis. These assemblages are described by preferred depths, dominant species, potential temperatures, salinities, potential densities, and locations. Shallowest occurring assemblage is within the core of the Lower Circumpolar Deep Water (LCDW), while the other two assemblages occur within transition zones between the LCDW and Weddell Sea Deep Water (WSDW). The difference in the benthic foraminiferal assemblages at similar depths on the Islas Orcadas Rise and the Maurice Ewing Bank is the result of different water-mass regimes separated by the Polar Front. (Auth. mod.)

Tambiev, S.B., **Authigenic sediment formation in the oceans,** *Oceanology,* Oct. 1986 26(2), p.164-170, Translated from Okeanologiia. 35 refs.

A large body of data is used to discuss the formation of suspended organic aggregates in sea water. During passage of air bubbles and formation of aggregates the pH of the sea water decreases and its alkalinity rises. The concentrations of dissolved Si and P in sea water also fall as a rule. The aggregates are films, clumps and flakes measuring from fractions of a micron to 200-300 microns. The physicochemical method of formation of aggregates is described and their effect on the balance of organic matter in the ocean and on present-day sedimentation is described. (Auth.)

Van Heijst, G.J.F., **On the oceanic circulation near a shelf-ice edge,** Dynamics of the West Antarctic Ice Sheet. Edited by C.J. van der Veen and J. Oerlemans, Dordrecht, D. Reidel, 1987, p.37-56, 18 refs.

This paper addresses the oceanic circulation near the shelf-ice edge, and concentrates on two aspects, namely the large-scale flow driven by wind stresses in the open sea, and the smaller-scale circulation driven by melting of the ice wall. Contrary to the expectation that (fresh) meltwater rises in a saline fluid environment, it is found that the latter simple flow pattern is destroyed by the presence of a salinity gradient in the ambient fluid.

Piola, A.R., Figueroa, H.A., Bianchi, A.A., **Some aspects of the surface circulation south of 20S revealed by First GARP Global Experiment drifters,** *Journal of geophysical research,* May 15, 1987 92(C5), p.5101-5114, 36 refs.

Daily averaged positions from about 280 satellite-tracked drifting buoys launched during the First GARP Global Experiment are used to estimate the sea surface current velocity field south of 20 S. The time-averaged surface velocity field based on velocity averages over 4 deg x 4 deg areas is used to construct the surface stream function. The gross features of the mean circulation are generally in agreement with other representations of the time-averaged circulation although they do differ in details from the climatological relative surface dynamic topographies in the Southern Hemisphere subtropical gyres. Mean and eddy horizontal momentum fluxes based on 2 deg x 2 deg grid are estimated for the region south of 40 S. The zonally averaged momentum flux at the sea surface for the region of the Antarctic Circumpolar Current, from 40 to 60 S, leads to a momentum flux divergence indicating a meridional flux of eastward momentum away from the current axis. Given the relatively large errors associated with the zonally averaged momentum fluxes, the sign of the flux divergence remains uncertain. (Auth.)

Grelowski, A., Majewicz, A., Pastuszak, M., **Mesoscale hydrodynamic processes in the region of Bransfield Strait and the southern part of Drake Passage during BIOMASS-SIBEX 1983-84,** *Polish polar research,* 1986 7(4), p.353-369, 17 refs.

An attempt was made to describe the dynamics of water masses in the southern part of the Drake Passage and the Bransfield Strait from Dec. 1983 to Jan. 1984. The dynamic topography at the surface (referred to 500 db surface) allowed to define the eastward flow of water in the Bransfield Strait and to observe, in the same region, the presence of a rather weak counter-current of Weddell Sea origin. In the Drake Passage, a general north-eastern direction of water flow of the Bellingshausen Sea was found. In the Bransfield Strait, as well as in the Drake Passage, the relative velocities of geostrophic flow were low: 0.22 and 0.06 m/s, respectively. The analysis of Rossby and eddy numbers and Rossby radius made it possible to regionalize the dynamic phenomena but could not be fully used for their classification. (Auth.)

Tréguer, P., Jacques, G., **Antarctic Ocean** [L'océan Antarctique], *Recherche,* June 1986 17(178), p.746-755, In French. 16 refs.

In the antarctic ocean region which sees a continual mixing of the waters of three of the world's large oceans, many paradoxes exist. The most puzzling of these is how a marine area, richest in nutrients, yet having such a poverty of phytoplankton, can support the large and diverse animal population inhabiting the region. This condition is discussed at length with consideration given to water chemistry, nutrients, water masses and currents, temperature, primary productivity, and the roles of krill, seals, and sea birds in the overall process.

Enikeev, V.Kh., **History of Southern Hemisphere water circulation in the Mesozoic and Cenozoic** [Istoriia tsirkuliatsii vod IUzhnogo polushariia v mezozoe i kaĭnozoe], Modelirovanie gidrofizicheskikh poleĭ i protsessov v okeane. (Modelling of hydrophysical fields and processes in the ocean). Edited by A.S. Monin and D.G. Seidov, Moscow, Nauka, 1986, p.43-48, In Russian. 13 refs.

Paleoceanographic circulation of the Southern Hemisphere in Late Mesozoic and the Cenozoic is investigated within the framework of a numerical model. It is shown that continental drift affected oceanic paleocurrents and paleoclimates which differ significantly from today's climate. The Cenozoic glaciation was related to the formation of the Antarctic Circumpolar Current caused by the separation of Australia and Antarctica and the development of Drake Passage.

Grachev, IU.M., IUshina, I.G., **Comparison of results of synoptic prognosis with data from studies of the Antarctic Circumpolar Current polygon south of Africa** [O sopostavlenii rezul'tatov sinopticheskogo prognoza s dannymi nabliudeniĭ na poligone k iugu ot Afriki v Antarkticheskom tsirkumpoliarnom techeniiȷ, Modelirovanie gidrofizicheskikh poleĭ i protsessov v okeane. (Modelling of hydrophysical fields and processes in the ocean). Edited by A.S. Monin and D.G. Seidov, Moscow, Nauka, 1986, p.55-60, In Russian. 24 refs.

Based on Seidov's numerical model, calculations were carried out on the evolution of synoptic eddies in the open areas of the ocean. The primary conditions were observed in full-scale surveys of the polygon in the Antarctic Circumpolar Current. It is found that theoretical results agree with the survey data. It is shown that cyclonic eddies occurring north of the main current shift toward the west by approximately 30 km during a period of the order of a week.

Fukui, F., Otomo, K., Okabe, S., **Nutrients depression in the blooming area of Prydz Bay, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Dec. 1986 Special issue No.44, Symposium on Polar Biology, 8th, 1985. Proceedings, p.43-54, 15 refs.

During the SIBEX cruise of *R.V. Kaiyo Maru* to the Indian Ocean in 1983/84, nutrient depression in the phytoplankton blooming was observed in the innermost part of Prydz Bay. The lowest concentrations of inorganic phosphate (0.30 microgram-at/l, dissolved total phosphorus (1.06 microgram-at/l), nitrate (10.5 microgram-at/l) and silicate (8 microgram-at/l) as well as chlorophyll *a* (2.19 microgram/l) was high. These low concentrations of inorganic nutrients are attributable to the consumption by phytoplankton. Phosphate and silicate seem to be consumed faster than nitrate. (Auth.)

J-35684

Whitworth, T., III, Nowlin, W.D., Jr., **Water masses and currents of the southern ocean at the Greenwich Meridian,** *Journal of geophysical research,* June 15, 1987 92(6), p.6462-6476, 51 refs.

The frontal structure of the Antarctic Circumpolar Current (ACC) at the Greenwich Meridian is similar to that at Drake Passage even though the current is not confined to flow between two continents: there are sharp horizontal gradients in all properties throughout the water column, the fronts are narrow relative to the total width of the current, and most of the transport occurs within the frontal zones. East of Drake Passage, saline North Atlantic Deep Water (NADW) is incorporated into the Circumpolar Current, and at the Greenwich Meridian it influences the water characteristics as far south as the Polar Front. Transport within the ACC at our section is about 20% greater than at Drake Passage, probably due in part to the addition of NADW. Separating the ACC from the Weddell Gyre is a sharp front, south of which the signature of all but the densest Circumpolar Deep Water (CDW) is lost by mixing with the surface waters. The intermediate water of the central Weddell Gyre is formed from this dense CDW, which is modified by biochemical processes to become oxygen poor and nutrient rich. Warm, salty, less dense CDW from the southern edge of the ACC rounds the eastern end of the gyre and appears in the southern limb, which meanders around Maud Rise. (Auth.)

Matsuda, O., Ishikawa, S., Kawaguchi, K., **Oceanographic and marine biological data based on the routine observations near Syowa Station between Feb. 1984 and Jan. 1985 (JARE-25),** *Japanese Antarctic Research Expedition. JARE data reports,* Mar. 1987 No.121, 21p., 2 refs.

A three-year program of marine biological investigations in the fast ice area near Showa Station is reported. Water samples for physical and chemical analyses were collected from different depths, between Feb. 18, 1984, and Jan. 6, 1985, at three locations, which are listed and shown on a map. Seasonal variations of ice breakage and formation processes are shown on charts; water temperature, salinity, chemistry and pigment ratio are tabulated. Some data on plankton collected by vertical haul are also presented.

Hayden, B.P., Ray, G.C., Dolan, R., **Classification of coastal and marine environments,** *Environmental conservation,* Autumn 1984 11(3), p.199-207, 25 refs.

Marine and coastal areas are classified in this paper according to attributes of the physical environment and by the faunal assemblages involved. Oceanic and coastal-margin realms are defined and mapped with the marginal seas and archipelagos named according to their connections to oceanic realms. There are seven types of ocean realms and thirteen types of coastal-margin realms. Latitudinal symmetry is present between hemispheres and from ocean basin to ocean basin. The defining characteristics for these realms are the seasonal variations in ocean surface currents and the companion seasonal variations in the main wind-currents of the atmosphere. Forty faunal provinces are indicated on the six maps of the oceanic and coastal realms, one of the maps showing the proposed classification in the antarctic region. (Auth. mod.)

Barrera, E., Huber, B.T., Savin, S.M., Webb, P.N., **Antarctic marine temperatures: late Campanian through early Paleocene,** *Paleoceanography,* Feb. 1987 2(1), p.21-47, Refs. p.44-47.

An oxygen isotope paleotemperature study of benthic foraminifera from the upper Campanian through lower Paleocene section at Seymour I. was done in conjunction with careful scanning electron microscope observations to monitor the state of foraminiferal preservation. The isotopic compositions of those samples which were deemed to be well preserved were the basis of the conclusion that Campanian through Paleocene high-latitude shelf waters near Antarctica had temperatures between approximately 4.5 and 10.5 C. Temperatures during early and middle Maastrichtian time were slightly higher than those of either the late Campanian or late Maastrichtian. The inference of temperate climatic conditions in Antarctica is in agreement with paleoclimatic conclusions drawn on the species composition of the planktonic foraminiferal assemblages and the character of the planktonic foraminifera. Campanian through early Paleocene deep ocean waters, at least in the Pacific and perhaps elsewhere as well, could have formed by sinking of surface waters in polar regions. (Auth. mod.)

Middleton, J.H., Foster, T.D., Foldvik, A., **Diurnal shelf waves in the southern Weddell Sea,** *Journal of physical oceanography,* June 1987 17(6), p.784-791, 16 refs.

Strong evidence is presented for the existence of barotropic shelf waves at diurnal frequencies in the shelf-break region of the southern Weddell Sea. Rotary spectra from long-term current meter records on the slope, at the shelf break and on the shelf show the same rotational sense as that predicted by a barotropic model. Phase speeds of the zero-mode shelf waves calculated from tidal analysis and rotary coherencies of current meter pairs oriented in an along-shelf direction are in the same range as that predicted by barotropic theory except for the O1 constituents. The weak stratification of the Weddell Sea in the region of the slope results in nearly barotropic motion at diurnal frequencies. The anomalous behavior of the O1 constituent could not be explained. (Auth.)

Ventajas, L., **Polynucleate hydrocarbon concentrations from oil spilled in seawater** [Incidencia del aceite derramado sobre la concentración de hidrocarburos polinucleados en aguas de mar], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1986 No.322, 15p., In Spanish with English, French and German summaries. 5 refs.

A study on the variation of the concentration of polynucleate hydrocarbons in the course of time, when a ship anchored in stations adjacent to the Weddell Sea spilled oil, showed the following: near Marambio Station, the concentration of polynucleates increased at the time the ship was surrounded by ice, and decreased when the ice disappeared. Near Belgrano II Station, the concentration of polynucleates increased in the course of time until it reached a constant. It is concluded that the ice acts as a barrier preventing the longitudinal and transversal diffusion of polynucleate hydrocarbons and allowing them to concentrate. (Auth. mod.)

Bogorodskiĭ, P.V., Makshtas, A.P., **Spatial and temporal variability of the sound velocity field in the Maud Rise area** [Prostranstvenno-vremennaia izmenchivost' polia skorosti zvuka v raĭone podniatiia Mod], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1986 Vol.108, p.72-75, In Russian. 5 refs.

Results of hydrophysical investigations, centered on the distribution of speed of sound waves in the Weddell Sea, are presented. Data show measurements in the range of 1400 to 1600 m/s, with maximum error of 0.2 m/s and minimum sensitivity of 0.01 m/s. In depths greater than 300 m, the field of sound velocity was determined by an empirical formula based on temperature and salinity measurements at different depths. A table shows a strong spatial irregularity in the 110-140-m layer. It is found that in the deep waters of the Weddell Sea the warm eddies move in a westerly direction; this cyclonic rotation is responsible for the convective instability of the upper 300-m layer in the Maud Rise region.

Sarukhanian, E.I., Tokarchik, R., **Hydrological conditions in Admiralty Bay in summer 1982** [Gidrologicheskie usloviia v zalive Admiralti letom 1982 g.], *Sovetskaia antarkticheskaia ekspeditsiia. Informatsionnyĭ biulleten',* 1986 Vol.108, p.78-85, In Russian. 5 refs.

In 24 oceanographic stations, established between Jan. 28 and Feb. 16, 1982, in Admiralty Bay, temperature, salinity and dissolved oxygen content—ranging from 0.36-2.23C, 31.5-34.5%, and 5.69-8.24ml/l, respectively—were measured in a water layer from 0 to 250 m. The data obtained served as a basis for estimating the hydrological conditions in the Bransfield Strait, whose waters border on those of Admiralty Bay. These waters were found to differ in that the vertical convection, originated by the freezing of the Strait's waters, results in a renewal of deep waters, while the rises along the borders of the Strait prevent the intermixing of the Strait's waters with those of neighboring regions.

Schlosser, P., Roether, W., Rohardt, G., **Helium-3 balance of the upper layers of the northwest Weddell Sea,** *Deep-sea research,* Mar. 1987 34(3A), p.365-377, 22 refs.

Helium-3 data of the upper water column (800 m) at stations in the northwestern Weddell Sea and in the Bransfield Strait are presented and discussed in relation to the hydrography. From the observations a He-3 balance for the winter mixed layer is proposed, which allows to estimate the rate of entrainment of Warm Deep Water (WDW) into the Winter Water to be between 15 and 35 m.y. The vertical eddy diffusivity within the pycnocline above the Warm Deep Water core is determined. Of the assumptions required to obtain the WDW entrainment estimate, that of quasi-stationarity of the gas transfer across the pycnocline appears to be the most critical one, but other assumptions appear to require further study as well. (Auth. mod.)

Poisson, A., Chen, C.-T.A., **Why is there little anthropogenic CO2 in the Antarctic Bottom Water,** *Deep-sea research,* July 1987 34(7A), p.1255-1275, Refs. p.1273-1275.

Late-winter and early-spring carbonate data compared with summer data confirm the notion that the Weddell Sea pack ice effectively blocks the air-sea exchange of gases. The upwelled old Weddell Deep Water (WDW) dilutes the anthropogenic CO2 concentration in the winter surface water, which then mixes with the Weddell Shelf Water and more WDW to form the Antarctic Bottom Water (AABW). Since the WDW probably was formed before industrialization and the winter surface water is also deficient in excess CO2, it was expected and found that the AABW contains little anthropogenic CO2. The dilution of the winter surface water by the old WDW also explains why less excess CO2 is found in the remnant winter water (the minimum temperature layer) than in the surface water for the GEOSECS and IGY summer stations. The pre-industrial CO2 concentration is estimated to be 268 micro-atm. (Auth.)

Kobarg, W., Lippmann, E., **Tidal movement measurements on the Ekström Ice Shelf, Antarctica** [Gezeitenmessungen auf dem Ekström-Schelfeis, Antarktis], *Polarforschung,* 1986 56(1/2), p.1-21, In German with English summary. 14 refs.

Part of the geophysical work at the German Georg von Neumayer Station is the recording of the tidal movement of the Ekström Ice Shelf. Measurements are performed with an earthtide gravity meter for the vertical component of the movement and two simple tiltmeters for the horizontal components. Gravity measurements were done continuously during the 1984/85 winter season at the observatory of the Georg von Neumayer Station. Tilt measurements were carried out at the station and at three locations on an ice-rise at about 10 km distance from the station. Gravity measurements provide the tidal movements of the ice shelf, which amounts to about 1 m at spring tide. The most important result of the tiltmeter measurements lies in the fact that the amplitudes of tilt are substantially larger at the ice-rise than at the observatory. Results of tide-correlated ice quake activities are also presented. (Auth.)

Ikeda, Y., Silveira Mascarenhas, A. da, Jr., Cacciari, P.L., Nonato, L.V., **Synoptic account of the Subtropical and Antarctic Convergence** [Um levantamento sinótico das Convergencias Antarctica e Subtropical], *Academia Brasileira de Ciencias. Anais,* 1986 58(1-Suppl.), p.111-116, In Portuguese with English summary. 14 refs.

Temperature profiles of the water column (0-750 m) were obtained with XBT along two tracks during the 2nd Brazilian Antarctic Expedition. During the first track the Antarctic Convergence zone was observed between 57 deg 30'S and 58S, with a horizontal gradient of 3.5 C/42 km. A bulk temperature of 6 C was identified as the Antarctic Circumpolar Current, a length scale of 130 km width was estimated for the cross section. The second track crossed again the Antarctic Convergence zone 16 days later at 55 deg 20'S, approximately, suggesting a mean latitudinal displacement of 15 km/day. The second pass across the Convergence showed a warming in the temperature field. (Auth. mod.)

J-36251
Ikeda, Y., **Environmental parameters of the Bransfield Strait, Antarctica,** *Academia Brasileira de Ciencias. Anais,* 1986 58(1-Suppl.), p.117-135, 12 refs.

Hydrographic data based on Nansen-bottle casts were obtained in the Bransfield Strait during Jan. and Feb. 1983 The temperature and salinity values ranged from -1.2 C to 2.0 C and 33.8 to 34.6, respectively. The cold (more saline) and the warmer (less saline) waters are found close to the Antarctic Peninsula and the South Shetland Is. respectively, suggesting the influence of the Weddell Sea Water which through advective and mixing processes contributes to the formation of water masses in the Strait. The upper 600 m of the water column show a decrease in the temperature (up to -1.2 C) and an increase in the salinity (up to 34.6); temperature inversions associated with vertical instabilities of the water column were found usually in the upper 50 m depth. The geostrophic circulation relative to the 200 and 400 dbar isobaric surfaces, indicates a weak meandering surface current flowing towards NE, in agreement with previous studies in the area. (Auth. mod.)

Paviglione, A.M., Ikeda, Y., Cacciari, P.L., **Thermal structure of Bransfield Strait and Drake Passage** [Estrutura térmica do Estreito de Bransfield e da Passagem de Drake], *Academia Brasileira de Ciencias. Anais,* 1986 58(1-Suppl.), p.149-156, In Portuguese with English summary. 5 refs.

A comparative description of the vertical and horizontal temperature fields sampled along and across the Bransfield Strait was done using data collected during the 2nd Antarctic Brazilian Expedition. In the horizontal distributions of temperature we can notice that the lowest temperature values (-1.4 C in the surface layer and -1.1 C at 100 m), are observed NE of the Antarctic Peninsula and the highest values (2.7 C in the surface layer and 0.5 C at 100 m), northward of South Shetland I. The vertical distributions of temperature show a layer of minimum temperature (0.5 C) between depths of 100 and 200 m across the Bransfield Strait. This minimum temperature layer is found to vary from depths of 100 m to 250 m toward higher latitudes in the vertical sections oriented parallel to the Bransfield Strait in the Drake Passage. (Auth.)

Gregory, M.R., **Plastics and other seaborne litter on the shores of New Zealand's subantarctic islands,** *New Zealand antarctic record,* 1987 7(3), p.32-47, 23 refs.

Contamination of open ocean and coastal surface waters by plastics and other man-made debris is today a topic of increasing concern to environmentalists. This report deals with observations on quantities and sources of plastic and other man-made items stranding on the shores of New Zealand's subantarctic islands. Most readily accessible shores were examined other than those around the deeply indented harbors characterizing the eastern (leeward) sides of Campbell and Auckland Islands. The nature of the terrain ensured that intensive sampling for mainland shores was impossible. Hence, quantitative expression in terms of number of items per kilometer of shore is not considered appropriate. Some shore localities were 'scanned' from afar (cliff tops, zodiac, helicopter). Types and distribution of various kinds of litter, both natural and man-made, are noted and an assessment of its impact on these subantarctic islands is given. (Auth. mod.)

Liebezeit, G., Bodungen, B. von, **Biogenic fluxes in the Bransfield Strait: planktonic versus macroalgal sources,** *Marine ecology progress series,* Mar. 1987 36(1), p.23-32, 56 refs.

Fluxes of organic carbon and nitrogen, total phosphorus, chlorophyll pigments, carbohydrates, amino acids and amino sugars were determined for a depth-series sediment trap experiment in Nov./Dec. 1983 in the Bransfield Strait, Antarctic Peninsula. Absolute and/or relative increases of phosphorus, glucose and chlorophyll *b* fluxes and decrease of beta-alanine flux with depth suggest a second source of sedimenting organic material besides plankton. This is identified as originating from shallow water macroalgae. Quantification of this contribution shows increases from 37% at 539 m to 71% at 1835 m. Comparison of corrected planktonic fluxes with values predicted by an earlier empirical equation are in good agreement. Examination of carbohydrate spectra from Bransfield Strait surface sediments shows a macroalgal imprint to be present. (Auth.)

Escánez, J.E., **Preliminary observations on the distribution of micronutrients during the *Antártida 8611* cruise (Nov. 1986-Feb. 1987)** [Observaciones preliminares sobre la distribución de micronutrientes durante la campaña *Antártida 8611* (Noviembre 1986-Febrero 1987)], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.21-36, 10 refs., In Spanish with English summary.

The cruise *Antártida 8611* was carried out in the Scotia Sea and Bransfield Strait during the austral summer 1986-1987. Fifty deep sampling hydrographic stations were studied for different physicochemical parameters. Among these were dissolved micronutrients, nitrates, nitrites, phosphates and silicates, sampled down to 500 m depth. Some representative profiles are described and the N/P and Si/N ratios for the different areas are compared. Distribution of micronutrients in the lagoon of Deception I. is also studied. (Auth. mod.)

Alvarez Meneses, A., **Chlorophyll *a* distribution in the Atlantic sector of the Antarctic in the austral summer 1986-1987, *Antártida 8611*** [Distribución de clorofila *a* en el sector Atlántico del Océano Antártico durante el verano austral 1986-1987 *Antártida 8611*], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.37-46, 4 refs., In Spanish with English summary.

The study was carried out in the Scotia Sea and nearby areas, Nov. 25, 1986-Feb. 2, 1987, the determination of chlorophyll *a* distribution being one of the principal goals. A total of 58 oceanographic stations were studied on board the fishing vessel *Pesca Puerta IV.* The results show a high concentration of chlorophyll *a* around Orkney Is. and minimum values around South Shetland Is. and Bransfield Strait, with the exception of station 535, in the interior of Deception I., and station 512 in its vicinity. (Auth. mod.)

Juliá, A., **Analysis of tides observed at Arctowski Station (King George Island), Nov.-Dec. 1986** [Análisis de las mareas observadas en la estación H. Arctowski (Isla de King George) entre Noviembre y Diciembre de 1986], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.47-53, In Spanish with English summary.

During the stay of the Spanish expedition at Arctowski Station, data on sea level, atmospheric pressure and wind conditions were regularly collected. The results of the analysis of the data using the autocorrelation test applied to the time series, are presented. In order to minimize the effect of air pressure on the sea level, the data were reduced to 1013.25 HPa. Before calculation of the correlation coefficient, the time series was also standardized. The results allow to identify the most significant periods contained in the series. (Auth. mod.)

Grimalt, J.O., Albaigés, J., Rovira, J., Ballester, A., **Dissolved and particulate lipids in Bransfield Strait, *Antartic' 86*** [Lípidos en fase disuelta y particulada de las aguas del estrecho de Bransfield, *Antartic' 86*], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.79-87, 9 refs., In Spanish with English summary.

This initial report on the lipid composition of the waters of Bransfield Strait shows that it consists mainly of fatty acids (free and esterified) and sterols, reflecting a predominant algal input. Among these components there is an important proportion of labile species (mono- and diunsaturated fatty acids, diunsaturated sterols) which points to a low degree of microbial activity in the area as well as to good physico-chemical conditions of preservation. (Auth.)

Ballester, A., **Distribution and levels of heavy metals in antarctic and subantarctic waters. BIOMASS-III Expedition *Antartic' 86*** [Distribución y trascendencia de los metales pesados presentes en aguas antárticas y subantárticas. Expedición Biomass-III, *Antartic' 86*], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.99-105, 12 refs., In Spanish with English summary.

An operative and sensitive procedure was developed to determine trace element concentrations in ocean waters. This method involves the following steps: sampling, filtration, complexation, solid-phase extraction, clean-up and Zeeman Graphite Furnace A.A.S. Analysis. This procedure has been applied in studying zinc, copper, manganese, lead and iron levels in antarctic and subantarctic sea water samples collected during BIOMASS-III Expedition cruise *Antartic' 86.*

Rovira, J., **Chlorinated hydrocarbons in water samples from Bransfield Strait. BIOMASS-III Expedition *Antartic' 86*** [Hidrocarburos clorados en muestras de agua del estrecho de Bransfield. Expedición Biomass-III, *Antartic' 86*], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.107-115, 10 refs., In Spanish with English summary.

Presented are results of analyses of chlorinated hydrocarbons (PCB's and chlorinated pesticides) in dissolved and particulate phases in water samples from Bransfield Strait. The analyses were done using high resolution gas chromatography. The concentrations found for all the contaminants studied were in the same very low ranges as those reported in previous works for antarctic seas. The levels found in the samples from Bransfield Strait are lower than those calculated in samples from the Atlantic Ocean. (Auth.)

Sánchez-Pardo, J., Rovira, J., **Aliphatic and polycyclic aromatic hydrocarbons in Bransfield Strait waters. BIOMASS-III Expedition, *Antartic' 86*** [Hidrocarburos alifáticos y aromáticos policíclicos detectados en aguas del estrecho de Bransfield. Expedición Biomass-III, *Antartic' 86*], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.117-124, 5 refs., In Spanish with English summary.

This work deals with the analyses of aliphatic hydrocarbons (C14 to C32) and polycyclic aromatic hydrocarbons (PAH's) realized in sea water samples from Bransfield Strait, as a part of general sampling taken in Biomass III cruise. The samples were fractionated in dissolved and particulate phases obtained by passing a 100 l sample of sea water through the sampling system: a glass fiber filter (GF/F, 0.7 microns) and an Amberlite column (XAD-2). High Resolution gas chromatography techniques were used. The capillar column employed was a RSL-200 phase, chemically bonded, 25 m long and 0.2 micrometer phase thickness. The samples were observed for aliphatic hydrocarbons, covering the range of 3-10 ng/l, showing a carbon preference index below 1.0. Phenantrene was the predominant PAH in the samples studied. (Auth.)

Bryan, F., **High-latitude salinity effects and interhemispheric thermohaline circulations,** *Nature,* Sep. 25, 1986 323(6086), p.301-304, 18 refs.

A general circulation model for the ocean is used to investigate the interaction between the global-scale thermohaline circulation and the salinity distribution. It is shown that an equatorially asymmetric circulation can be maintained even under equatorially symmetric basin geometry and surface forcing. Multiple equilibrium solutions are obtained for the same forcing by perturbing the high-latitude salinity field in an otherwise equatorially symmetric initial condition. The timescale of the transition from the symmetric circulation to an asymmetric circulation depends critically on the sign of the initial salinity perturbation. Accompanying figures include data for the antarctic and sub-antarctic regions. (Auth. mod.)

Murav'ev, S.S., Nozdrin, IU.V., Pyzhevich, M.L., **Thermohaline finestructure in the Antarctic Circumpolar Current along a section at 25E,** *Oceanology,* Feb. 1987 26(4), p.428-432, Translated from Okeanologiia. 3 refs.

The characteristics of the finestructure were analyzed along a section at 25E passing through the antarctic circumpolar current in the layer from 150 to 700 m. The finestructure includes inhomogeneities with scales from 40 cm to 33 m, and is analyzed for various water masses of the section. It was found that the ratio of the spectral densities for variations in the temperature and salinity fields decreases with increasing wave number. The value of the spectral density for variations in the temperature field increases toward the south in the section and also in regions where eddy formations interact. (Auth.)

Eremeev, V.N., Ivanov, L.M., **Ocean tracers: transport parametrization, numerical modelling of dynamics** [Trassery v okeane: parametrizatsiia perenosa, chislennoe modelirovanie dinamiki], Kiev, Naukova dumka, 1987, 144p., In Russian. 220 refs.

Problems related to numerical modelling of tidal, inertial and synoptic variations of ocean currents are analyzed through extensive review of pertinent literature. Sections of the 4th chapter of the book deal with optimum placing of surface buoys for studying ocean circulation in the South Atlantic Ocean and calculations of surface circulation of the southern ocean, between latitudes 20 and 65S, based on drifting buoy data obtained during the PGEP Experiment. Average monthly circulation and temperature values for Jan. 1979, and isotope distribution of radium-228 concentrations, are discussed and shown on charts. A relationship between the latter and the current depth dynamics is established.

Ohno, M., Fukuda, Y., Fukuchi, M., **Vertical distribution and standing stocks of chlorophyll *a* in the coastal waters of the antarctic ocean,** *Antarctic record,* July 1987 31(2), p.93-108, 15 refs.

The vertical distributions of chlorophyll *a,* phaeophytin and oceanographic parameters to a depth of 200 m were investigated in 3 areas: 9 stations in Breid Bay, 7 stations off the Gunnerus Bank and 7 stations in Lützow-Holm Bay. Water temperature ranged from -1.87 to 2.1 C, and salinity ranged from 32.63 to 34.63. Salinity was 32.63-33.95 throughout the upper 0-50 m layer, in which chlorophyll *a* was abundant. In Breid Bay, integrated chlorophyll *a* stocks (0-200 m) decreased from 230.0-410.7 mg/sq m in Dec. to 95.1-207.2 mg/sq

m in Feb. In the waters across the Gunnerus Bank, integrated stocks ranged from 41.9 to 116.5 mg/sq m in Feb. In the waters off Lützow-Holm Bay, the stocks remained between 46.0 and 78.3 mg/sq m. The phaeophytin content was large at almost all the stations. (Auth.)

Iwanaga, Y., Tohju, H., **Oceanographic data of the 27th Japanese Antarctic Research Expedition from Nov. 1985 to Apr. 1986,** *Japanese Antarctic Research Expedition. JARE data reports,* July 1987 No.127, 56p.

This report presents the data of oceanographic observations on board the icebreaker *Shirase* and tidal observations at Showa Station. The oceanographic observations were carried out in the summer mission of JARE-27, in 1985-1986, and tidal observations were carried out in the winter mission of JARE-26, in 1984-1985. Included are surface temperature measurements and surface water chemical analyses, the expendable bathythermography, the conductivity temperature and depth profiling system observations, and serial observations carried out at 26 stations. All the results, together with meteorological data, are tabulated.

Douglas, B.C., McAdoo, D.C., Cheney, R.E., **Oceanographic and geophysical applications of satellite altimetry,** *Reviews of geophysics,* June 1987 25(5), p.875-880, Refs. p.878-880.

One of the most difficult aspects of the use of altimeter data is finding the correct track point over land and ice surfaces. Waveform data must be carefully analyzed to solve this problem. This has been accomplished to a high degree of precision and applied successfully to the Greenland and antarctic ice fields. Important new insights into the nature of satellite ephemeris error and its influence on altimetrically derived sea surface topography are discussed. (Auth. mod.)

Saki, T., **Preliminary report of geological and geophysical surveys off Queen Maud Land, East Antarctica,** NIPR Symposium on Antarctic Geosciences, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1987, p.23-40, 15 refs.

Geological and geophysical surveys off Queen Maud Land were carried out during the 1985-1986 season using R/V *Hakurei-Maru.* The survey covered areas of Gunnerus Ridge and the upper continental rise to the abyssal plain off Showa Station. The basement of Gunnerus Ridge is supposed to be continental crust according to magnetic data, gravity data, sonobuoy data and dredged rocks. The oceanic basement is confirmed in seismic and gravity data to have a deepening trend and to form a thickening sedimentary basin toward the foot of the continental slope. The maximum depth and thickness exceed 9.0 s in two-way time from sea level and 3.0 s in two-way time between sea bottom and acoustic basement, respectively on seismic lines. The age difference of the oceanic crust is discussed using seismic character difference of the top of acoustic basement. The sediment section of the basin is divided into 3 prominent sequences and discussed in terms of seismic stratigraphy. The heat flow data show slightly lower values than a world ocean average value, and this may suggest that the age of the oceanic basement in this area is relatively old. (Auth.)

Locarnini, R.A., Gallardo, G.A., **Data from XBT A.R.A. *Bahía Aguirre* Antarctic Summer Campaign, 1979-1980. First Stage** [Datos de XBT A.R.A. *Bahía Aguirre* Campaña Antártica de Verano 1979/1980. Primera Etapa], *Buenos Aires. Instituto Antártico Argentino. Informe de datos,* Mar. 1987 No.1, 37p., In Spanish with English summary. 6 refs.

Data obtained from 22 drops carried out in Leg 1 of the Antarctic Summer Campaign, 1979-1980, on board the *Bahía Aguirre* are reported. The data were collected on a NW-SE course, between the Falkland Is. and South Georgia, providing information on the thermal structure of the first 450 m of the water column in the area, for determination of the Antarctic Polar Front and the Weddell-Scotia Confluence in krill studies. Tabulated results and charts constitute the bulk of this report.

J-36744

Naqvi, S.W.A., **Some oceanographic observations in the polynya and along a section in the southwest Indian/antarctic ocean,** *India. Department of Ocean Development. Technical publication,* 1986 No.3, p.75-85, 30 refs.

Hydrographical and hydrochemical observations have been made at a shelf station off Princess Astrid Coast, Dronning Maud Land, Antarctica, and at 11 other stations along a transect from Antarctica to about 30S latitude. The shelf station, located in a trough, was occupied at 1-month interval in Jan. and Feb. Significant vertical and temporal variations in temperature and salinity are restricted to the upper 200 m; the water is more or less homogeneous below this depth, probably trapped in the trough and renewed by the winter convection. There is some near-surface thermohaline stratification, especially pronounced in Jan. Substantial warming of surface waters occurs from Jan. to Feb., resulting in the melting of ice which reduces the surface salinity. A sub-surface oxygen maximum is observed in Jan. associated with a maximum in primary production. Oxygen concentrations at all depths exhibit decreases from Jan. to Feb. in conjunction with increases in nutrients except phosphate, probably resulting from the oxidation of organic matter following high primary production in Jan. Vertical sections of temperature, salinity, potential density, dissolved oxygen, apparent oxygen utilization, phosphate, nitrate, silicate, pH and alkalinity through Antarctic, subantarctic and subtropical zones are presented and discussed. (Auth. mod.)

Houry, S., Dombrowsky, E., May, P. de, Minster, J.F., **Brunt-Väisälä frequency and Rossby radii in the South Atlantic,** *Journal of physical oceanography,* Oct. 1987 17(10), p.1619-1626.

Brunt-Väisälä frequency profiles have been calculated in the South Atlantic and neighboring regions on a 5 deg x 5 deg grid between 30N and 70S, 70W and 70E, using the annual mean temperature and salinity profiles computed by Levitus from data available from the National Oceanographic Data Center (NODC). These Brunt-Väisälä frequency profiles are used in the computation of the first and second internal Rossby deformation radii. The external Rossby radius is computed for reference. These results compare very well with earlier computations for the equatorial Atlantic. Very small values of the radii are evidenced in the extreme south (less than 10 km in the Antarctic Circumpolar Current for the first internal mode). High vertical variability in Brunt-Väisälä frequency profiles is also observed at the center of the subtropical gyre. This behavior is probably due to the lack of deep data in this region. (Auth.)

Cherry, M.I., Cherry, R.D., Heyraud, M., **Polonium-210 and lead-210 in antarctic marine biota and sea water,** *Marine biology,* Nov. 1987 96(3), p.441-449, 47 refs.

Concentrations of the naturally-occurring radionuclides Po-210 and Pb-210 were measured in krill *(Euphausia superba),* mesozooplankton, phytoplankton and sea water collected during the South African SIBEX cruise to the Antarctic in autumn 1984. The data reported constitute the first substantial measurements of Po-210 and Pb-210 in such samples in the Antarctic Ocean. The concentrations of Po-210 in mesozooplankton and phytoplankton are unexceptional in comparison with those from other oceans. The SIBEX *E. superba,* however, have higher levels of Po-210 than usually found in euphausiids. The Po-210 data, combined with reasonable estimates of biological quantities such as the fractional assimilation, are used to obtain information about the diet of *E. superba.* It is suggested that the higher Po-210 in the SIBEX *E. superba* reflects a change from an almost entirely phytoplanktonic diet in summer to a more omnivorous diet as winter approaches. The data show that there are allometric relationships between the Po-210 content of euphausiids and animal size; these are discussed briefly. The limited sea-water data presented are characterized by unusually high Po-210:Pb-210 activity ratios and need further investigation. (Auth.)

Nelepo, B.A., Grishin, G.A., Kienko, IU.P., Koval', A.D., **Optical methods of satellite hydrophysics. Environmental investigations from automatic satellites** [Opticheskie metody sputnikovoĭ gidrofiziki. Issledovanie okruzhaiushcheĭ sredy s avtomaticheskikh ISZ], Kiev, Naukova dumka, 1986, 157p., In Russian with abridged English table of contents enclosed. 196 refs.

After discussing technical aspects of studying the ocean in the optical range, methods and means of spaceborne surveys, and processing of video data, satellite observations of large-scale changes in ocean and atmosphere, wave dynamics, and the bio-optical state of the ocean are discussed and illustrated. In the portion describing the large-scale changes in the ocean and atmosphere, the following concerns the Antarctic: the cyclonic surface circulation of the southern ocean waters differs from that in the Northern Hemisphere. A map to that effect is presented of long period averages of global surface currents during the northern winter. Spaceborne data for the period Jan. 8-15, 1983, shows that cyclogenesis covers a period of 7 days, cyclone dimensions vary between 300 and 1200 km, and the speed of motion from 180 to 420 km/day. Upon reaching the coast, the cyclones become stationary. Also presented and discussed is an illustration based on satellite data showing bands of clouds over the Southern Hemisphere for the 1969-1971 period.

J-36991
Foster, T.D., Foldvik, A., Middleton, J.H., **Mixing and bottom water formation in the shelf break region of the southern Weddell Sea,** *Deep-sea research,* Nov. 1987 34(11A), p.1771-1794, 13 refs.

The shelf break region of the southern Weddell Sea was investigated during the period 1977-1980 with sections of closely spaced CTD stations and long-term moored current meters. An intrusion of warmer water onto the shelf from intermediate depths offshore was found in all cross-shelf sections. Evidence that this warmer water intrudes onto the shelf throughout the year was found in the current meter temperature records. Continental shelf waves appear to be the most likely mechanism for bringing this warmer water onto the shelf. Mixing of very cold water on the shelf with the warmer intruded water appears to be promoted by stirring induced by the semidiurnal tides. The mixing also may be directly caused by shear instabilities. Bottom water that forms near the shelf break and flows down the continental slope in the southern Weddell Sea appears to represent a mixture of the cold shelf water with the warmer intruded water and not cold, dense shelf water alone. (Auth.)

Motoi, T., Ono, N., Wakatsuchi, M., **Mechanism for the formation of the Weddell polynya in 1974,** *Journal of physical oceanography,* Dec. 1987 17(12), p.2241-2247, 18 refs.

The formation of the Weddell Polynya is investigated with a one-dimensional, convective mixed-layer model, using *in situ* data from late summer 1974 as initial conditions. It is proposed that a high-salinity mixed layer in summer resulted in the formation of the Weddell Polynya in 1974. The model results show that the high salinity allows deep convection driven by surface cooling alone, and the resulting upward transfer of heat and salt prohibits sea-ice formation throughout the winter, subject to the freshwater input less than 0.4 m/yr. Because of the uncertainty of amount of the actual freshwater input in 1974, whether sea ice formed is ambiguous. However, the occurrence of the deep convection during the 1974 polynya formation is confirmed by summer data from 1975, showing the modification of deep water to be colder, fresher and richer in oxygen than in 1974. The upward heat flux through the deep convection resulted in the formation of the Weddell Polynya in 1974. (Auth.)

Mikhaĭlovskiĭ, IU.A., Mikhal'tseva, T.V., **Hydrochemical studies in the Riiser-Larsen, Cosmonauts', and Commonwealth seas,** *Oceanology,* Apr. 1987 26(5), p.592-593, Translated from Okeanologiia 26(5), 1986. 2 refs.

During Jan.-Mar. 1984, the 22nd SAE carried out interdisciplinary investigations in the southern Indian Ocean sector gathering data at about 200 stations. The stations were placed mainly on meridional sections to a depth of 1200 m or to the seafloor in shallower depths; the extreme northern stations were located at 59.5-60S, and the extreme southern stations on the edge of the drifting ice. The expedition examined the distribution of the hydrochemcial characteristics of dissolved oxygen, phosphates, nitrates, nitrites, and silica. Data were obtained for the first time on organic phosphorus. (Auth. mod.)

Guretskiĭ, V.V., **Surface thermal fronts in the Atlantic sector of the southern ocean,** *Soviet meteorology and hydrology,* 1987 No.8, p.67-73, Translated from Meteorologiia i gidrologiia. 15 refs.

Based on historical data on the surface temperature of the ocean in cross sections, the position of thermal fronts and their statistical characteristics in the Atlantic sector of the southern ocean were determined. It is shown that the main thermal fronts (Subtropical, Subantarctic, and Arctic Polar) are tracked throughout the entire sector, and the fronts are expressed much more clearly in the western area of the sector than in the central and eastern areas. Comparison with results of diagnostic calculations of currents shows that the Subantarctic and Antarctic Polar fronts are confined respectively to the northern and southern streams of the Antarctic Circumpolar Current (ACC), which has a two-stream structure in most of the sector. (Auth.)

Lukowski, A.B., Ligowski, R., **Cumulation of chloroorganic insecticides by antarctic marine diatoms,** *Polish polar research,* 1987 8(2), p.167-177, 11 refs.

In summer 1983-1984 samples of planktonic and attached diatoms were collected in the Admiralty Bay as well as in the region of South Orkneys, Drake Passage and Bransfield Strait. Using gas chromatography, residues of chloroorganic pesticides namely the compounds of the DDT group and HCH isomers, were determined. It was found that the highest values of the content of these compounds occurred in attached diatoms coming from areas continuously washed with water from the melting glacier, in planktonic diatoms from the samples of the Admiralty Bay and from strongly glaciated regions. The hypothesis is put forward that, along with the direct atmospheric transport, the release of the deposits of these compounds from ice and glaciers during their melting is an additional source of input of chloroorganic biocides into antarctic waters. Diatoms are good indicators of this process. (Auth.)

Holloway, G., **Systematic forcing of large scale geophysical flows by eddy-topography interaction,** *Journal of fluid mechanics,* Nov. 1987 Vol.184, p.463-476, 30 refs.
DLC QA901.J87

The interaction of eddies with variations in topography, together with a tendency for large-scale wave propagation, generates a systematic stress which acts upon large-scale mean flows. This stress resists the midlatitude tropospheric westerlies, resists the oceanic Antarctic Circumpolar Current, and may be a dominant mechanism in driving coastal undercurrents. Associated secondary circulation provides a systematic upwelling in coastal oceans, pumping deeper water onto continental shelf areas. The derivation rests in turbulence closure theory and is supported by numerical experiments. (Auth.)

Hodgkinson, R.P., Colman, R.S., Kerry, K.R., Robb, M.S., **Water currents in Prydz Bay, Antarctica during 1985,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Mar. 1988 No.59, 127p., 2 refs.

Four moorings were deployed in Prydz during 1985 to collect information at four depths at four sites on water speed, direction, temperature, and in some cases, conductivity. The reduced data and notes on the data acquisition methods and locations are presented. Some initial comments on the characteristics of the data are given and some speculation on the implications of the data is included. An initial description of the physical oceanography of Prydz Bay provided the first input to a database of sufficient intregrity and quantity for numerical modelling purposes. (Auth.)

Anderson, J.B., Domack, E.W., **USAP 1988 Cruise III, RV *Polar Duke* cruise report,** [1988], 22 leaves.

USAP Cruise III of *Polar Duke* began Dec. 22, 1987 and had two major goals: to investigate sedimentation in the fiords along the continental shelf on the western side of the Antarctic Peninsula, and to conduct a seismic and coring survey on the shelf between 68W and 63W. Specific tasks included: search for evidence of prior episodes of glacial waxing and waning; examine tectonic and sedimentological evolution; collect a closely spaced set of seismic reflection lines; test current models for glacimarine sedimentation; acquire a suitable sedimentary record related to Holocene climatic variation; gain insight on sedimentation processes in fiords. Results of these endeavors are presented and discussed.

J-37282
Keffer, T., Holloway, G., **Estimating southern ocean eddy flux of heat and salt from satellite altimetry,** *Nature,* Apr. 14, 1988 332(6165), p.624-626, 16 refs.

An outstanding problem in the oceanic and atmospheric sciences is the rate of heat and fresh water transport from the equator to the poles, for it is this transport which powers the Earth's weather and climate system. Closing the Southern Hemisphere balances has proven particularly difficult because of the dominance of eddy fluxes across the Antarctic Circumpolar Current. Their relatively small space, but long time scales, make any *in situ* measurement program prohibitively expensive. Satellite data was used to estimate the overall eddy activity and a turbulence closure scheme to relate this to eddy flux. The resulting estimated heat flux is sufficient to supply the heat lost to the atmosphere south of the Antarctic Polar Front. Estimated salinity flux is found to be poleward at high latitude—in the

wrong direction to compensate for the observed excess of precipitation over evaporation south of the Polar Front. (Auth.)

J-37283

De Szoeke, R.A., **Heat flux in the Antarctic,** *Nature,* Apr. 14, 1988 332(6165), p.585-586, 9 refs. For the item being commented on see J-37282.

Comments are made critiquing the theory of Keffer and Holloway on eddy flux in the southern ocean. They are commended for pointing out the usefulness of satellite measurements in their theory but arbitrary adjustments in the model are questioned. More detailed results over a longer time span are needed to test the validity of the model.

Van Ypersele, J.P., **Numerical study of the response of the southern ocean and its sea ice to a CO2-induced atmospheric warming,** *National Center for Atmospheric Research. Cooperative thesis,* 1986 NCAR/CT-99, 135p., PB87-163218, Refs. p.110-135.

A comprehensive coupled model of ocean circulation and sea ice has been developed to study a selected area of the southern ocean that includes the Weddell Sea and the Drake Passage. An existing general circulation model of the ocean was configured for the geometry of the southern ocean domain and then improved by including robust-diagnostic forcing and allowing for coupling to a sea-ice model. When the model was initially tested without coupling, the ocean circulation corresponded well with the observed circulation. In addition, a dynamic-thermodynamic model of sea ice was developed and tested with a constant upward oceanic heat flux. (Auth. mod.)

Miller, D.G.M., **South African SIBEX II cruise to the Prydz Bay region, 1985: cruise description and preliminary review of results,** *South African journal of antarctic research,* 1987 17(2), p.105-111, With Afrikaans summary. 22 refs.

South Africa's participation in SIBEX II in the south Indian Ocean (48-64E) during Feb.-Mar. 1985 is summarized. The two basic objectives of the cruise were to provide a temporal comparison of oceanology in the region with earlier results from an Australian survey and to undertake meso/fine-scale studies of various processes associated with krill *(Euphausia superba)* swarm dynamics. Unfortunately, survey work had to be prematurely curtailed as a result of rudder damage to the ship the R/S *Africana.* A review of data collected is given and an attempt is made at their interpretation. Workshop to Develop Scientific Ocean Drilling Initiatives in the South Atlantic and Adjacent Southern Ocean, **Summary report,** Woods Hole, MA, 1987, 60p., Refs. p.57-60.

Goals of the workshop were to develop suites of drilling objectives in the South Atlantic by stressing themes and to broaden the base of expertise on which ocean drilling programs rest. Areas of the antarctic waters are included in the discussions as regions mainly yet unknown but recognized as highly influential on other areas of the world. Major discussion groups were aligned on the topics of evolution of oceanic lithosphere/tectonics; biostratigraphy; physical stratigraphy/sedimentary record; and geochemistry. Summaries of the deliberations of these discussion groups are presented.

Husby, D.M., Muench, R.D., **Hydrographic observations in the northwestern Weddell Sea marginal ice zone during March 1986,** *U.S. National Oceanic and Atmospheric Administration. NOAA technical memorandum NMFS,* Jan. 1988 NOAA-TM-NMFS-SWFC-106, 33p., PB88-173 240, 7 refs.

Temperature and salinity observations were made from the surface down to 1500 m to sample the 3 water masses characterizing the region. The uppermost, Surface Water, layer extended to 30-50 m, had temperatures from near freezing (-1.8 C) up to about 0 C and salinities of 33-34 ppt. A layer of Weddell Winter Water underlay the Surface Water, extending to about 100 m, and had temperatures of -1.5 to -1.7 C and a salinity of about 34.46 ppt. The Weddell Warm Deep Water extended from the bottom of the Winter Water to more than 1500 m, displaying temperature increasing with depth to a maximum of about 0.5 C near 500 m then decreasing to 1500 m. Salinity increased with depth in this layer to about 34.67 ppt near 500 m, then decreased slightly at greater depths. A warm core having temperatures greater than 0.5 C was present near 500 m depth in the westernmost part of the study region. The temperature maximum region within the Warm Deep Water decreased in depth eastward, toward the center of the gyre, within this core. The baroclinic circulation, expressed as dynamic topography of the surface relative to the 1500 db level, was insignificant throughout the region. (Auth.)

Nowlin, W.D., Jr., Zenk, W., **Westward bottom currents along the margin of the South Shetland Arc,** *Deep-sea research,* Feb. 1988 35(2A), p.269-301, 36 refs.

Existing information is synthesized and new data presented to describe the flow of near-bottom water from the Weddell Sea into the Scotia Sea and westward through Drake Passage along the continental slope. The water characteristics and currents along the northern margins of the South Sandwich Island Arc are examined. Long-term current measurements in the bottom waters at locations over the outer shelf and slope and along the continental rise show persistent flow from Atlantic to Pacific along isobaths at speeds of 10-20 cm/s. Three sources for the waters in these currents are identified and discussed. At the deepest levels, Weddell Sea Deep Water enters the Scotia Sea near 40W through a depression in the South Scotia Arc and then flows westward, constrained by the bottom topography. Mid-depth waters may flow from the Weddell Sea to the Scotia Sea through the Powell Basin, sill depth approximately 200 m. The westward flowing waters along the shelf and upper continental slope, which are denser than those immediately offshore, may be a continuation of the Polar Slope Current from the Weddell Sea or may be derived principally by convection from the shelves of the South Sandwich Island Arc. A vertical section north of Elephant I. shows downslope convection off the shelf, analogous to that observed at many locations around Antarctica. (Auth.)

Fukuchi, M., Hattori, H., **Surface water monitoring system installed on board the icebreaker *Shirase*,** NIPR Symposium on Polar Biology, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1987, p.47-55, 8 refs.

A surface water monitoring system was designed and installed on board the icebreaker *Shirase*. The system consists of sensors unit, navigation information terminal and control unit. Water pumped up from an intake of hull (8 m depth) is led into the sensors unit so as to measure flow rate of water, water temperature, conductivity, dissolved oxygen, fluorescence intensity, size composition of plankton and concentration of nutrient salt. Analog signals from these sensors as well as digital data from navigation information terminal (GMT, position, ship's speed, sea depth, water and air temperature) are transferred into the contorl unit at intervals of every five minutes. All data are stored on a floppy disk mounted in the control unit simultaneously. A post data processing system enables data editing, graphic displaying of time series data and geographical mapping. A field experiment in JARE-27 (1985/86) to the antarctic ocean revealed the usefulness of the present system for detecting fine-micro scale temporal and spatial variations of phytoplankton in relation to the oceanographic variables. Lutjeharms, J.R.E., Shannon, L.V., Beekman, L.J., **On the surface drift of the southern ocean,** *Journal of marine research,* May 1988 46(2), p.267-279, 32 refs.

Drift rates of the sea surface have been calculated for the South Atlantic and South Indian Ocean sectors of the southern ocean using drift cards and FGGE buoys. Drift patterns and drift rates, based on results from 40,000 plastic drift cards placed from 1978 to 1981, indicate significant equatorward surface exchange between the Southern Ocean and subtropical ocean gyres. Card drift rates increase with latitude up to the 40-45S zone. Average zonal drift rates lie between 10.3 cm/s and 16.4 cm/s. Zonally averaged drift rates of FGGE buoys are also at a maximum between 40 and 45S but are 15% higher; lowest rates are 12.2 cm/s. Significant differences in the drift rates between sectors of the same zone reflect the influence of bottom topography. (Auth.)

Peltier, W.R., **Lithospheric thickness, antarctic deglaciation history, and ocean basin discretization effects in a global model of postglacial sea level change: a summary of some sources of nonuniqueness,** *Quaternary research,* Mar. 1988 29(2), p.93-112, 38 refs.

The global model of postglacial relative sea level variations that has been developed over the past decade is employed to investigate the constraints that it may be invoked to place on the timing of the deglaciation of West Antarctica. A large number of Southern Hemisphere relative sea level data are shown to require that the retreat of antarctic ice substantially lagged the retreat of Northern Hemisphere ice if the deglaciation of Antarctica was abrupt. The time of onset of the antarctic deglaciation is thereby shown to coincide with the time of most rapid Northern Hemisphere deglaciation. Sensitivity tests are performed which demonstrate that this result is relatively insensitive to the discretization employed to represent the ocean basins; the only exception to this general rule obtains at some coastal sites at which a trade-off is revealed between the delay of west antarctic melting and the thickness of the lithosphere required to reconcile the observed local variations of relative sea level. At such sites, which are all in the far field of the ice sheets, some attention must be paid to the accuracy of the local finite element representation of the oceans and to details of antarctic deglaciation history. (Auth.)

Rodger, A.S., Cowley, S.W.H., **Observations of the effects of DPY currents at sub-auroral latitudes,** *Planetary and space science,* Jan. 1986 34(1), p.41-45, Refs. p.44-45.

Magnetograms from Lerwick, Scotland and Halley, Antarctica are used to show that the effects of the DPY current system can frequently be detected at these sub-auroral observatories. It is found that the magnetic perturbations associated with the DPY current dominate any effects that may be caused by the dawn-dusk displacement of the DP2 current resulting from the imposition of the *y*-component of the interplanetary magnetic field, *By*. The magnitude of the DPY current effect appears to be directly related to that of *By*, which is contrary to results from stations within the polar cap. There is no apparent seasonal variation in the frequency with which DPY effects are seen at Halley and Lerwick. (Auth.)

Igarashi, K., **Solar-terrestrial disturbances of June-September 1982. 4. Ionospheric disturbances. 13. Aurora observation using the Syowa Station 50-MHz Doppler radar,** *Radio Research Laboratory, Tokyo. Journal,* Mar. 1986 33(Special Issue No.1), Solar-terrestrial disturbances of June-Sep. 1982, p.269-277, 13 refs.

A new 50-MHz Doppler radar with a mini-computer for real-time data processing and radar control was installed at Showa Station in Feb. 1982. Severe geomagnetic disturbances occurred at about 00 h UT, 14 July 1982. A magnetic *H* component decrease of about 4200 nT was observed at Showa Station, and one of about 630 nT at Kakioka Magnetic Observatory. 50-MHz backscatter echoes were received on 13-14 July 1982 during a substorm growth phase; the rough estimates of the Doppler velocity during this period were obtained. Doppler spectra are discussed in the following 3 stages: SSC onset, substorm main phase and recovery phase. On the hypothesis of spatially homogeneous plasma flow, a large-scale electric field was determined by combining the drift velocities along the radar beams. It appeared that the *E* region electric field was larger than 30 mV/m in the main phase of this substorm. (Auth.)

Rodger, A.S., Brace, L.H., Hoegy, W.R., Winningham, J.D., **Poleward edge of the mid-latitude trough—its formation, orientation and dynamics,** *Journal of atmospheric and terrestrial physics,* Aug. 1986 48(8), p.715-728, 55 refs.

Data from the advanced Ionospheric Sounder (AIS) deployed at Halley and the Dynamics Explorer-2 spacecraft (DE-2) are used to investigate several aspects of the formation processes and dynamics of the polcward edge of the mid-latitude electron density trough. These include a study of the flux and energy of charged particles precipitating into the *F*-region as a function of Magnetic Local Time. Local energetic electron precipitation is a major source of ionization of the poleward edge in the evening sector, but after magnetic midnight transport processes become more important. Occasionally a significant increase in the flux of conjugate photo-electrons is colocated with the poleward edge of the trough in the morning sector. Some possible mechanisms are discussed but no firm conclusions are drawn. A comparison of the equatorward motion of the poleward edge on many nights is used to show that *Kp* is a poor index to use in any empirical model for predicting the temporal variations of the location of the trough. (Auth. mod.)

Lanzerotti, L.J., **Possible evidence of flux transfer events in the polar ionosphere,** *Geophysical research letters,* Nov. 1986 13(11), p.1089-1092, 27 refs.

Magnetic field data from the cusp-latitude South Pole Station are presentcd. These exhibit, under appropriate local time and interplanetary magnetic field conditions, the signature expected in the ionosphere from a flux transfer event (FTE) at the magnetopause. In particular, the model of multiple X-line reconnection at the magnetopause predicts field-aligned currents in helical flux tubes, with transverse magnetic fields propagating as Alfvén waves toward the ionosphere. The distinctive magnetic signature at a polar cap magnetic station, particularly in the vertical component, can be used to infer the signs of the B(y) and B(z) components of the interplanetary magnetic field. Maslanyj, M.P., Damaske, D., **Lessons regarding aeromagnetic surveying during magnetic disturbances in polar regions,** *British Antarctic Survey. Bulletin,* Nov. 1986 No.73, p.9-17, 8 refs.

During aeromagnetic surveying in high geomagnetic latitudes problems of severe (>100 nT) diurnal magnetic disturbances are experienced. The effect is assessed of the diurnal variations on the aeromagnetic records, recorded in the Martin Hills (geomagnetic latitude 70.56, geomagnetic longitude 6.2) West Antarctica. The diurnal records are compared with global disturbance patterns and data from the geomagnetic observatory at Halley (geomagnetic latitude 66.2, geomagnetic longitude 26.5). The results demonstrate the limitations of operating at such latitudes and suggests that base stations monitoring diurnal variation should be within at least 100 km of the survey area. The effect of the diurnal disturbances can be reduced by restricting flights to the daily quiet magnetic periods which are predictable. (Auth.)

Gledhill, J.A., **Magnetospheric substorm observed at Sanae, Antarctica,** *Journal of geophysical research,* Mar. 1, 1987 92(A3), p.2461-2475, 36 refs.

A magnetospheric substorm that occurred at Sanae, Antarctica, on July 27, 1979, was observed by a variety of techniques. A synthesis of the observations is presented, and an attempt made to deduce details of the behavior of the magnetosphere-ionosphere system during the cvent. While there was some evidence of a growth phase, it was inconclusive. At the onset there was a rapid change in the tail field, which assumed a more dipolar form, accompanied by Pi 2 oscillations and the precipitation of 6-keV electrons, with brightening of

the auroral arc, auroral-type sporadic *E* ionization, and riometer absorption. A positive spike was observed in the *D* magnetic component, instead of the expected negative one. There was no evidence of the usual westward traveling surge at the beginning of the expansion phase during which the precipitation region, auroral arc, and electrojet moved rapidly poleward, though it may have occurred outside the field of view from Sanae. The *Hbeta* emission increased by a factor of less than 2, whereas the oxygen and nitrogen emissions monitored increased by 3-4. During the recovery phase, phenomena were consistent with a return of the tail field to an elongated form; a very high ratio of 557.7-nm/630-nm emissions, exceeding 10, was observed; and the electrojet lagged noticeably behind the photon emission regions. (Auth.)

DLC QC811.G383

Averaged typical ionograms of distant oblique-incidence sounding were obtained for Mar. 1979 over the extended path Moscow-Molodezhnaya Station by the method of graphic superposition of experimental ionograms. Ionograms were also calculated by the adiabatic method with the use of the global analytical equinoctial model of electron density of the ionosphere, EMI-81. A comparison of the ionograms is conducted. The calculations show that the EMI-81 model, on the average, reflects the regularities of the ionospheric plasma distribution.

DLC QC811.G383

The meridional distribution of the amplitude of Pc3 in the region of high latitudes is investigated. It is shown that the maximum of the Pc3 amplitude coincides with the position of the dayside cusp and moves upon a change in the magnetic activity according to the change of the cusp position. Stations whose data was used in this study are located in the immediate vicinity of the southern geomagnetic pole (Vostok Station), in the region of projection of the dayside polar cusp (Mirnyy Station), in the auroral zone (Molodezhnaya Station and Novolazarevskaya Station), and in the subauroral zone (Kerguelen Island).

Cazeneuve, H., Grinspon, M., Tabocchini, H., **Collective geomagnetic response in several antarctic stations,** *Revista de geofisica,* 1984 40(1), p.53-64, 13 refs.

Data from 6 antarctic stations were analyzed in search of an ordered structure in the geomagnetic variations previously observed at Belgrano Station. Results of cross-correlation and interspectral analysis provide conclusive evidence of a collective response in the ensemble of stations, when the magnetic activity is excited. Conditions of linearity of the coherency analysis implies in turn that in the disturbed epochs a similar energy distribution does exist over an extended area of Antarctica. This area should be homogeneously disturbed, producing a high by correlated and spatially coherent pattern of activity at the involved stations. Finally, the interspectral analysis provides a further characterization of the medium in which the signals propagate, since some bands of frequency with a high coherency level persist over prolonged periods. These frequencies can be considered an invariant characteristic of the medium. (Auth.)

Inan, U.S., Carpenter, D.L., **Lightning-induced electron precipitation events observed at *L* approx 2.4 as phase and amplitude perturbations on subionospheric VLF signals,** *Journal of geophysical research,* Apr. 1, 1987 92(A4), p.3293-3303, 29 refs.

In 1983, the phase and amplitude of signals from the NPM transmitter in Hawaii (23.4 kHz) and the Omega transmitter in Argentina (12.9 kHz) were measured at Palmer Station, together with the magnetospheric whistler background. The long baseline and over-sea great circle paths from these two sources make it possible for the observed perturbations to be interpreted using a single waveguide mode theory. Analytical expressions are used to relate the magnitude of the phase perturbations to differential changes in ionospheric reflection height along a segment of the propagation path. The predicted relationship between relative perturbation sizes on the two different signals is compared with measurements. From this information, the range of whistler-induced flux levels and the shape of precipitation regions are inferred. (Auth. mod.)

Carpenter, D.L., Inan, U.S., **Seasonal, latitudinal and diurnal distributions of whistler-induced electron precipitation events,** *Journal of geophysical research,* Apr. 1, 1987 92(A4), p.3429-3435, 11 refs.

Whistler-induced electron precipitation events have been studied by means of data sets acquired in 1982-1983 at Palmer and Siple stations. The data sets confirm previous indications of a broad maximum in hourly event occurrence rates. The peak was centered approx 1-2 hours after local midnight at Palmer for the roughly north-south Argentina Omega 12.9-kHz path, but shifted several hours later for the 23.4-kHz NPM path, which has a westerly arrival bearing at Palmer. The previously reported seasonal variation, with peaks at the equinoxes, was confirmed; activity persisted in the austral winter, particularly following a magnetic storm, but in general occurred on fewer days and during shorter daily periods. Comparisons of occurrence data at Siple and Palmer for particular signal sources showed the

number of days of activity to be larger at Palmer by a factor of 2 or more. Comparisons of five months of simultaneous Palmer and Siple receptions of 21.4-kHz NSS signals on north-south paths suggest that most of the events observed at Siple occurred as the result of ionospheric perturbations relatively close to the *L* shell of Palmer. Sergeeva, N.G., **Radio auroral observations at the daytime cusp,** *Geomagnetism and aeronomy,* [Jan./Feb.] 1983 (Pub. Aug. 1983) 23(1), p.120-122, 11 refs., Translated from Geomagnetizm i aeronomiia.

DLC QC811.G383

On the basis of experimental data on a radio aurora in the daytime cusp, its behavior is described as observed at Mirnyy Station, in different seasons and in relation to different signs of the Bz- and By-components of the interplanetary magnetic field (IMF). It is demonstrated that the origin of radio auroras in the daytime cusp is strongly dependent upon the components of the IMF, reaching a probability of 0.7 at $Bz>0$ and $By<0$. In a series of cases when $By<0$ and $Bz>0$, small time intervals (about 15 min) are present when radio auroras are not recorded. The radio auroras occur in all seasons of the year, but in a number of cases the radio reflections decrease from winter to summer. The region of radio aurora recording is displaced by 2-3 deg toward the pole.

DLC QC811.G383

In order to study the winter features for electron cencentration variations in the *D* region of the Southern Hemisphere, measurements were made in May-July 1981 on Kerguelen I. of the ne(h) profile and the atmospheric temperature and wind. Data obtained under quiet geomagnetic conditions were selected for the analysis of experimental material. The value of the local aggregate daily *K*-index was utilized. The possible reason for the deviation of the July 8 profile is considered from the general correlation picture. The experimental data presented illustrate several characteristics of the winter anomaly phenomenon in the Southern Hemisphere and the relation of the ne variations in the winter period to the meteorological processes in the middle atmosphere.

Bol'shakova, O.V., Troitskaia, V.A., Zaĭtsev, A.N., **Diagnostics of the dayside cusp with northern direction of the interplanetary field according to the data of a chain of automatic magnetic variation stations in Antarctica,** *Geomagnetism and aeronomy,* [May/June] 1983 (Pub. Dec. 1983) 23(3), p.416-417, 3 refs., Translated from Geomagnetizm i aeronomiia.

DLC QC811.G383

The diagnostics of the position of the dayside cusp were based on data obtained from a chain of automatic magnetic variation stations (AMVS) located in Antarctica from Mirnyy to Vostok stations. Days with maximally low activity were selected, on which B2 of the interplanetary field was greater than 0, during May-June 1975. In this case the cusp is shifted towards the pole, and for large positive B2 it can even reach the near-polar region. The diurnal variations of the *ipcl* amplitude from the five automatic stations, and from Mirnyy Station, are presented. It is pointed out that a chain of stations with a spacing about 1 deg offers the possibility not only of determining the position of the cusp but also of investigating the fine structure of its motion upon a variation of the solar-wind parameters and determining directly the width of the cusp projection itself. The position of the cusp under identical conditions is compared in the Northern and Southern Hemispheres, with the conclusion that the seasonal shift of the position of the dayside cusp does not depend on the level of magnetic activity if the difference between the simultaneous positions of the cusp in both hemispheres is assumed to be caused only by the difference in the seasons.

Gaines, E.E., **Correlated electron and X ray measurements of quiet time electron precipitation: a comparative study of bremsstrahlung production and transport in the atmosphere,** *Journal of geophysical research,* Dec. 1986 91(A12), p.13,455-13,462, 18 refs.

Five cases of X ray observations from balloons coordinated with measurements of precipitating electrons were obtained during passes of the polar-orbiting satellite P78-1 near Siple Station, the launch point of the balloons. The observations, made during a geomagnetically quiet period in late Dec. 1980 to early Jan. 1981, showed small enhancements of the X ray fluxes ($E>25$ keV) and moderate trapped electron fluxes ($E>68$ keV) with pitch angle distributions extending into the edge of the loss cone sufficient to produce the <0.5 dB of cosmic noise absorption recorded by the Siple 30-MHz riometer. Bremsstrahlung production and transport in the atmosphere were calculated using the measured electron fluxes, energy spectra, and pitch angle distributions for the source. The X ray fluxes and spectra cal-

culated for the balloon altitudes were in good agreement with those measured from the balloons. The observed electron fluxes show that a significant continuous electron precipitation occurs at the western edge of the South Atlantic magnetic anomaly even at times of low geomagnetic activity. Tolstoy, A., Rosenberg, T.J., Inan, U.S., Carpenter, D.L., **Model predictions of subionospheric VLF signal perturbations resulting from localized, electron precipitation-induced ionization enhancement regions,** *Journal of geophysical reseach,* Dec. 1, 1986 91(A12), p.13,473-13,482, Refs. p.13,481-13,482.

This study uses a waveguide mode theoretic propagation model to predict the effect of localized ionization enhancement D regions on nighttime long-path VLF signals from the U.S. Navy navigational transmitters NSS, NAA, NLK and NPM to antarctic receiving stations, principally the U.S. station at Palmer. These predictions are then compared with the observed signal behavior in Trimpi events from which inferences can be drawn about a D regions's approximate location, size, and particle characteristics. The propagation model considers multiple modes, variable ground conductivity, and mode conversion. D regions of variable length (typically 50-150 km) and distance from the receiver (up to 600 km) were considered. Calculations show that some signal paths are more sensitive than others to perturbation by D regions and that the size of a D region is less important than its distance from the receiver. For a specified flux, higher-energy electrons produce larger effects than lower energy electrons; for a specified energy, larger fluxes will produce larger signal changes. This study also examines the effects of transmitter-induced electron precipitation on the VLF signals. Such precipitation is known to occur and, as shown here, may on occasion have important effects on certain signals. (Auth. mod.)

Pomerantz, M.A., **Advances in solar seismology at the South Pole,** *Antarctic journal of the United States,* 1985 20(5), p.221-222, 2 refs.

Austral summer 1984-1985 was the most successful campaign thus far for the full-disk helioseismology project. The new modified instrument obtained good quality observations for a total of 480 hours. There were several uninterrupted long runs ranging as high as 6 1/2 days of coronal seeing. Using the data shown, it has been possible to achieve one of the stated objectives of the progam—i.e., to address the question of the frequency dependence of the ratio of the amplitudes of the intensity and Doppler-shift oscillations. Intensity observations of the solar atmosphere temperature minimum were made from the geographic South Pole using a 6-angstrom filter centered on the calcium K-line and a two-dimensional diode array camera. Doppler-shift observations of a pair of photospheric spectrum lines near 6,191 angstroms were made at Kitt Peak using a large grating spectrograph and a similar camera. Both sets of observations were processed to produce power density spectra of zonal oscillations for spherical harmonic degrees 0 to 200. Non-oscillatory background power was subtracted and then the average power over degree ranges 10 to 200 and 50 to 150 was determined. As is shown, over the frequency range 2.5 to 5.0 mH the ratio of intensity fluctuation to Doppler-shift amplitude increases linearly with frequency by a factor of 3.0

Arnoldy, R.L., Cahill, L.J., Engebretson, M.J., **Pc 1 magnetic pulsations at the South Pole,** *Antarctic journal of the United States,* 1985 20(5), p.225-226, 3 refs.

150 days of spectrograms for South Pole were obtained. Based on what has been learned from both the phase relationship and the strong coincidence of South Pole events with Siple, it can be concluded that it is likely that the South Pole signals are horizontally ducted from lower latitudes. The South Pole noon maximum and the inverse correlation with magnetic activity (Ap) suggests that the horizontal ducting is strongly dependent upon the magnetic field topology and/or ionospheric conditions.

K-35550
Rosenberg, T.J., **Poleward surges of auroral phenomena over the South Pole,** *Antarctic journal of the United States,* 1985 20(5), p.227-228, 4 refs.

During magnetospheric substorms profound changes occur in the magnetic field configuration and in the energy and flow of plasma in the magnetotail. The dynamics of magnetotail plasmas and the relationship to substorm evolution are controversial topics. Currently two competing models describe the phenomenology in vastly different terms; the neutral-line model and the boundary-layer model. To evaluate the relative merits of these models, an examination has begun of the relationships among high-latitude auroral phenomena, substorm phase, and the behavior of magnetotail plasmas, using data from the extensive suite of auroral and ionosphere monitoring instrumentation at the South Pole. A characteristic feature of nightside auroral activity as viewed from the South Pole is the rapid poleward movement of auroral arcs. This feature is accompanied by a simultaneous intensification of electron precipitation. These events are shown in replicas of ionospheric charts and all-sky camera snapshots.

K-35552
Krishnaswamy, S., Rosenberg, T.J., **Riometer measurements of seasonal variations in auroral absorption at South Pole and Siple Stations,** *Antarctic journal of the United States,* 1985 20(5), p.231-233, 11 refs.

Because seasonal changes in auroral absorption are indicators of physical mechanisms governing magnetospheric phenomena; because auroral absorption disrupts high-latitude communications; because seasonal changes provide data for predictive models; and because Siple and Amundsen-Scott Stations lie on either side of the latitude of maximum absorption, it is of great interest to compare riometer data from both stations. Measurements made between 1975 and 1983 are analyzed. There appear to be important differences between Siple and South Pole Stations in the seasonal variation of auroral absorption. Possible explanations for these differences include a change in the characteristics of the precipitated electrons responsible for auroral absorption and/or differences in atmospheric composition and chemistry as one moves across the auroral zone. There are also differences in the relative seasonal absorption at a given site from year to year which may be related to the solar cycle. Both of these results also have important implications for high-frequency radio-wave propagation models at high latitudes.

K-35553
Krishnaswamy, S., Rosenberg, T.J., **Influence of long-term variations in solar radio noise on riometer quiet day curves,** *Antarctic journal of the United States,* 1985 20(5), p.233-234, 8 refs.

In the study of discrete, short-term phenomena, such as individual auroral absorption events, the quantity of interest is usually the excess absorption due to the event; this will not be significantly affected by slowly varying changes in the quiet day curves. However, in studies covering longer periods of time, especially periods involving an appreciable fraction of a solar sunspot cycle, such variations in the quiet day curves become significant. An example is presented of how the sunspot-cycle related changes in solar radio noise output can affect riometer quiet day curves.

Inan, U.S., Carpenter, D.L., **Very-low-frequency/low-frequency phase perturbations produced by whistler-induced electron precipitation,** *Antarctic journal of the United States,* 1985 20(5), p.235-237, 16 refs.

Phase changes of 0.1-1.0 microsecond on a 12.9-kHz signal arriving at Palmer over a 2400-km path are regularly observed with a characteristic signature of a rapid onset followed by a relatively slow recovery. The observed phase perturbations are interpreted to correspond to a rapid reduction in the effective nighttime ionospheric reflection height for the subionospheric VLF signals. The incident energetic particle fluxes that are required to produce the extra ionization are estimated to be .001-.01 erg/sq cm/s. Such flux levels are consistent with those estimated using theoretical models of whistler-particle resonant interaction as well as direct satellite-based observations of whistler-induced precipitation.

K-35555
Carpenter, D.L., Smith, A.J., **Using the Siple Station very-low-frequency transmitter as a multi-frequency probe of the Earth-ionosphere waveguide and magnetosphere,** *Antarctic journal of the United States,* 1985 20(5), p.238-239, 3 refs.

The Siple Station horizontal dipole transmitting antenna radiates appreciable power in only a narrow frequency range near the frequency to which the antenna system is tuned. This narrow range limits the uses of the transmitter; for example, it cannot be used simultaneously for both magnetospheric and Earth-ionosphere waveguide probing experiments, because the optimum frequencies used for these two kinds of experiments often differ widely. However, an unexpectedly large third-harmonic component of the transmitter signal has been observed recently at Halley Station. The properties of this newly observed component may help researchers to develop ways of expanding the frequency range—and thus improving the information gathering power of future experiments. These third harmonic frequency range expanding possibilities are discussed.

K-35556
Carpenter, D.L., **Large-amplitude oscillations of subionospheric very-low-frequency signals received in Antarctica,** *Antarctic journal of the United States,* 1985 20(5), p.239-241, 5 refs.

A new feature of subionospheric signal amplitude records is reported, in which the amplitude exhibits comparatively regular fluctuations that last for periods ranging from a few minutes to an hour or more. This phenomenon is particularly well defined in Siple Station records. Examples are shown of the fluctuations in Siple Station amplitude records of signals from Cutler, Maine, 17.8 kH and Annapolis, Maryland, 21.4 kH. A map of the Siple Station area is provided showing great circle paths from several VLF/LF signal sources. The fluctuations are called the "zigzag" effect, because they are more or less symmetrical about the amplitude maxima and minima and frequently exhibit a roughly triangular, or sawtooth-like shape, rather than a sinusoidal one. Periods of the fluctuations are typically in the 10-30-second range, while the amplitudes vary from a few percent to approximately 50 percent of the mean level.

Bell, T.F., Katsufrakis, J.P., James, H.G., **New type of very-low-frequency emission triggered at altitudes below 1,400 kilometers by signals from Siple Station,** *Antarctic journal of the United States,* 1985 20(5), p.241-242, 8 refs.

A new type of triggered very-low-frequency (VLF) emission has been discovered in ISIS-2 satellite data acquired at Siple Station for the period of Apr. through Oct. 1983 during joint VLF wave-injection experiments. The joint wave-injection experiments have four main components: (1) broadband VLF/ELF receivers on the ISIS-1 and ISIS-2 satellites; (2) a broadband (1 to 20 kH) controllable VLF transmitter at Siple Station; (3) various VLF navigation and communication transmitters, such as those of the world-wide Omega network; and (4) ground stations in the Antarctic and Canada. The new type of VLF emission is triggered by Siple transmitter pulses as they propagate through the ionosphere and low-altitude magnetosphere up to the ISIS-2 satellite at 1,400 km altitude. It is the only type of emission known to be triggered at low altitudes by manmade signals.

Pomerantz, M.A., Bieber, J.W., **New insights into cosmic-ray propagation in the heliosphere,** *Antarctic journal of the United States,* 1985 20(5), p.243-244, 5 refs.

Detailed information on the spatial distribution of cosmic rays in the heliosphere (the region of interplanetary space, extending beyond the orbit of Pluto, that is dominated by plasma emanating from the Sun) is essential for testing theories of the intensity modulations of galactic cosmic rays. An invaluable tool for probing this distribution in three dimensional space is the north-south anisotropy. The most recent study of this phenomenon was carried out to determine the relationship between the magnitude of the north-south anisotropy and the polarity of the Sun's poloidal magnetic field. The initial analysis confirmed the dependence upon the direction of the interplanetary magnetic field, but there was no indication of a dependence on the polarity of the solar poloidal field which was predicted by one of the two competing theories of the highly controversial mechanism of cosmic-ray modulation. There also seemed to be no indication that the north-south anisotropy varied with the phase of the solar cycle. However, the recent extension of the original data base from 1965-1981 to 1961-1983 has now unambiguously revealed that there is indeed a solar cycle variation of the north-south anisotropy.

Coco, D.L., Clynch, J.R., **Measurement of ionospheric electron columnar content changes over McMurdo Station,** *Antarctic journal of the United States,* 1985 20(5), p.244-245.

To study the effects of ionospheric scintillations on the tracking of navigation satellites in the southern polar regions, ionospheric electron columnar content change data at McMurdo Station from 1979 to the present have been collected. Much of the data was collected during the period around solar maximum (1979-1983), providing an important tool for studying the morphology and spatial structure of the ionospheric irregularities in the southern polar region. The data were acquired by one ground station observing satellites in different parts of the sky throughout the day. In this past season a bistatic experiment was conducted in which two ground stations, separated by up to 50 km, observed the same satellites simultaneously. These data should provide a more detailed view of the spatial structure of the ionospheric irregularities.

Makarova, L.N., Shirochkov, A.V., **Influence of the solar wind on auroral absorption events at very high geomagnetic latitudes,** *Journal of geomagnetism and geoelectricity,* 1986 38(11), p.1109-1114, 9 refs.

An investigation is made of numerous unusual appearances of auroral absorption events measured by riometers located at the center of the Southern polar cap. It is shown that such nighttime (in MLT) events take place during the expansion phase of magnetospheric substorms and are closely associated with both high velocity solar wind fluxes and strong negative *Bz* values. The polar ionosphere behavior is also studied. A model is available which seems to be an appropriate tool for describing the events if one takes into account the solar wind velocity. It is believed that the daytime polar cap auroral absorption events which are not as numerous and intense as their nighttime counterparts have a different origin. (Auth.)

K-35583
Engebretson, M.J., Meng, C.-I., Arnoldy, R.L., Cahill, L.J., Jr., **Pc 3 pulsations observed near the south polar cusp,** *Journal of geophysical research,* Aug. 1, 1986 91(A8), p.8909-8918, 33 refs.

Comparison is made of high time resolution search coil magnetometer data near local magnetic noon from South Pole Station for Jan. and June 1983 with energetic particle data from DMSP and DE 2 satellites and with interplanetary magnetic field data from the IMP 8 satellite. Broadband irregular magnetic pulsations with period range 0.5-40 s (Pi 1) observed at South Pole Station are associated with the proximity of strong >10-keV electron precipitation, with a somewhat weaker dependence on *Kp* and the proximity of the cusp. Large-amplitude Pc 3 pulsations also appear frequently in the data and are distinguished by their packetlike structure and their nearly monochromatic character. Pc 3 pulsations show little or no correlation with latitudinal position of the cusp, with magnetic activity, or with the presence of >10-keV electron precipitation, but their occurrence is strongly correlated with the *X* component of the interplanetary magnetic field, and their frequency is dependent on the magnitude of this field. The results suggest that no local sources need be postulated to explain the occurrence of Pc 3 pulsations at cusp latitudes and may suggest that upstream wave energy in the Pc 3 frequency range can reach low altitudes on cusp field lines. Fujii, R., **Conjugacies of pulsating auroras by all-sky TV observations,** *Geophysical research letters,* Feb. 1987 14(2), p.115-118, 13 refs.

Simultaneous observations of pulsating auroras were carried out in Sep, 1984, at a geomagnetically conjugate pair of stations: Showa Station in Antarctica and Husafell in Iceland. The following characteristics are found: spatial configuration of pulsating auroras is very similar in the conjugate regions. In this particular event each pulsating aurora has its counterpart with topologically the same shape in the other hemisphere. However, the timing of the appearance or fade-out of the pulsating auroras depends on the type of aurora. That is, the patchy type of aurora appears nearly simultaneously in both hemispheres, but the expansion type of pulsating aurora, extending from an aurora with much slower variations, is not synchronously observed and often appears almost out of phase between the conjugate regions. Nishino, M., Tanaka, Y., **Observations of auroral LHR noise by the sounding rocket S-310JA-6,** *Planetary and space science,* Jan. 1987 35(1), p.127-137, 25 refs.

Electromagnetic noise with banded structure was observed on the sounding rocket S-310JA-6 launched at night on Aug. 27, 1978 from Showa Station, which showed a sharply defined lower cutoff at approximately 5 kHz and an indefinite upper cutoff around 8 kHz corresponding to the lower hybrid resonance frequency of the ambient plasma of the rocket location. The directions of the wave and Poynting vectors and the estimated wave refractive indices indicate that the banded noise excited in the auroral ionosphere by energetic electron streams ($<$or$=5$ keV) in a Landau instability process propagates down to the rocket. Wolfe, A., **ULF geomagnetic power at cusp latitudes in response to upstream solar wind conditions,** *Journal of geophysical research,* Jan. 1, 1987 92(A1), p.168-174, Refs. p.173-174.

Energy densities are computed for geomagnetic field fluctuation in the Pc 3-4 range using *H* component magnetometer data recorded at South Pole Station over a three-month period from June 3 to Sep. 4, 1982. Hourly values of the energy densities in the Pc 3 and 4 period bands are found to be highly correlated during geomagnetic local daytime hours. The results of multivariate analyses between geomagnetic energies and upstream solar wind quantities show that the most important quantity in controlling the magnitude of the field fluctuations is the solar wind speed, with the IMF B component being of next importance. It is concluded that the Kelvin-Helmholtz instability at the dayside magnetopause is, statistically, the dominant energy source that contributes to ULF hydromagnetic wave activity at cusp latitudes. (Auth.)

Golian, S.F., **Frequency limits and modal structure of signals on the Moscow-Molodezhnaya route** [Predel'nye chastoty i modovaia struktura signalov na trasse Moskva-Molodezhnaya (Antarktida)], Vzaimodeĭstvie dekametrovykh radiovoln s ionosferoĭ. (Interaction of decametric radio waves with the ionosphere). Edited by L.A. Lobachevskiĭ, Moscow, Institut zemnogo magnetizma, ionosfery i rasprotraneniia radiovoln, 1985, p.81-93, In Russian. 9 refs.

Presented are adiabatic calculations and analysis of the propagation of decametric radio waves on the meridional Moscow-Molodezhnaya route, along 13.7 thousand km, for equinoctial conditions of high solar activity. The global model of the ionosphere was used. The propagation frequency limits are calculated for all channels related to the route, the modes of propagation and the frequency dependence on the time of signal propagation. Results of the calculations are compared with the corresponding mean experimental data.

Kuratani, Y., Maeno, H., **Riometer records of 30 MHz cosmic noise at Syowa Station, Antarctica in 1985,** *Japanese Antarctic Research Expedition. JARE data reports,* Mar. 1987 No.122, 94p.

Observations of cosmic radio noise, carried out at Showa Station with a standard riometer at 30 MHz, are reported. The hourly values of ionospheric absorption given in the cosmic noise absorption tables are the deviations, in dB, of cosmic noise intensity from the reference sidereal diurnal variation. The reference sidereal diurnal variation is determined from the diurnal variations on several selected quiet days in each month. The geomagnetic H-component is also recorded.

Igarashi, K., Maeno, H., Ogawa, T., **Records of radio aurora at Syowa Station, Antarctica in 1985,** *Japanese Antarctic Research Expedition. JARE data reports,* Mar. 1987 No.123, 56p.

Observations of ionospheric irregularities, carried out at Showa Station, are reported. The report includes the periods of radio auroral echoes detected in 1985 and characteristic examples of echo intensity-time variation. Data include 35 mm film records of radio auroral echo intensity with range (A-scope) and range-time intensity (A'-scope), chart records of the time variation of echo intensity, and digital magnetic tape records of the intensity and doppler velocity of auroral radar echoes. Explanations of the diagrams clarify the data showing aurora occurrence, non-occurrence, or periods of no observations.

Sakurai, H., Tonegawa, Y., Fujii, R., Sato, N., **Computer compilatory process of the data acquired by the computer system at Syowa Station,** *Antarctic record,* Mar. 1987 31(1), p.77-92, In Japanese with English summary. 5 refs.

Upper atmosphere physics data such as VLF, CNA, magnetic field and ULF have been continuously acquired by the MELCOM 70/25 computer system installed at Showa Station in 1981. The original digital data are compiled using the M-180 computer system at the Information Processing Center, National Institute of Polar Research. The compilatory processes are divided into the following four steps: reproduction of the original tape in order to check the recording conditions; preservation of the original data by changing the recording density on the magnetic tape from 1600 BPI to 6250 BPI; compilation of the utility format tape from the original data; and making summary plots for all of the compiled data. These data are available to users on request. (Auth.)

Smith, A.J., Yearby, K.H., **AVDAS—a microprocessor-based VLF signal acquisition, processing and spectral analysis facility for Antarctica,** *British Antarctic Survey. Bulletin,* May 1987 No.75, p.1-5, 24 refs.

A microcomputer-based system is described for the spectral analysis of VLF (0.5-20 kHz) radio waves received at Halley Station. The data are used for studying magnetospheric and ionospheric phenomena including whistler-mode propagation, wave-particle interactions, plasma distribution and drifts, and charged particle precipitation into the ionosphere. Apart from the microcomputer and standard peripherals (VDU, printer disc drives, serial and parallel interfaces, analogue-digital converters), the hardware consists of a specially designed spectrum analyser and spectrographic display unit. Extensive software has been developed. In this paper a technical description is accompanied by representative examples of data acquired and processed by the AVDAS. (Auth. mod.)

Gough, H., Jones, D., Yearby, K.H., **ULF/VLF correlator experiment at Halley,** *British Antarctic Survey. Bulletin,* May 1987 No.75, p.17-29, 28 refs.

This paper describes the scientific objectives and first results of a new ULF/VLF project at Halley Station. It also outlines the experimental system and describes its installation during the 1985-86 relief operations. It illustrates how the project fits coherently into the ongoing VLF and geomagnetic observations at Halley. It reports some of the previous observations in this field and the suggested mechanisms for the relationship between the ULF (<3 Hz) and VLF (0.5-10 kHz) waves and their interaction through the charged particles in the magnetosphere and in the ionosphere. The system extends the frequency range of magnetic variations recorded at Halley to cover the 'high' frequency Pc1/2 pulsations, and the relation of these pulsations to the plasmapause is discussed. Two examples of data recorded on the new system are presented, one a structured Pc1 event and the other a correlated ULF/VLF event identified from its cross-spectral phase. (Auth.)

Ono, T., Ejiri, M., Hirasawa, T., **Monochromatic auroral images observed at Syowa Station, in Antarctica,** *Journal of geomagnetism and geoelectricity,* 1987 39(2), p.65-95, 32 refs.

A new TV camera system was developed for monochromatic digital imaging of auroras. On the basis of observation in 1984 at Showa Station by the TV system, 3 types of auroral activities were analyzed: stable auroras in the dusk sector, active auroras, and pulsating auroras in the dawn sector. The results are: diffuse auroral belt which appears at the lower latitude border of auroral activity coincides

with the distribution of Hbeta emission; enhancement of auroral 5577 Angstrom emission is much larger than that of 6300 Angstrom emission at the westward travelling surge; and period of auroral pulsation in the dawn sector shows regional variations. The observation suggests that the diffuse aurora in the dusk sector at the lower latitude side is excited by auroral protons, and that a hardening of energy spectrum of precipitating electron is associated with the westward travelling surge. (Auth.)

Mizera, P.F., Gorney, D.J., Evans, D.S., **On the conjugacy of the aurora: high and low latitudes,** *Geophysical research letters,* Mar. 1987 14(3), p.190-193, 6 refs.

On December 5, 1983 the polar orbiting satellites NOAA-7 and DMSP-F6, while in opposite hemispheres, each crossed a narrow structure of auroral electron precipitation at nearly the same Universal Time (UT) and at the same high magnetic latitude local time location. The Operational Line Scanner image taken by DMSP-F6 of the northern polar region showed that this enhancement was associated with a sun-aligned arc (SAA) which extended poleward from the midnight sector auroral zone and passed across the polar cap very near to the magnetic pole. NOAA-7 observations show that the analogous precipitation structure in the southern hemisphere was embedded in a region of low intensity ion and electron precipitation which had the characteristics of the plasma sheet population. Comparisons between the boundaries of the lower latitude auroral zone precipitation and the electron distributions at those boundaries were also made. The results of these comparisons together with those made for the high latitude SAA argue for a high degree of interhemisphere conjugacy in the electron precipitation over a wide range of invariant magnetic latitudes. (Auth.)

Morris, R.J., Cole, K.D., **Pc3 magnetic pulsations at Davis,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.3-16, Refs. p.14-16.

A brief morphological study of Pc3 (10-45 s) ULF magnetic pulsations observed at the polar cusp latitude Davis Station is presented. A significant observation of these deeply amplitude-modulated near monochromatic Pc3 magnetic pulsations are their exceptionally large amplitudes, i.e. 32 nT; which may provide a ground diagnostic for the location of the last closed magnetic field lines, adjacent to the dayside polar cusp. Observational analyses include both diurnal and seasonal amplitude and occurrence distributions, power spectral analyses, dynamic sonagrams and polarization studies. (Auth.)

Craven, M., Burns, G.B., **Pulsating aurora and magnetic Pi(c) pulsations,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.17-33, 17 refs.

Strong peak-to-peak correlations, with average time delays less than a second, between auroral optical N2 1NG(0,1) band intensity variations and magnetic Pi(c) pulsations, as observed at Macquarie I. provide convincing evidence of a local ionospheric production mechanism for the magnetic pulsations. Theoretical modelling of an auroral pulsation patch is used to explain the general properties of the magnetic pulsations. The polarization of the Pi(c) pulsations is shown to be controlled principally by a delay between the Hall and Pedersen current fluctuations as measured at the ground, and the direction of the background E-region electric field. (Auth.)

Webster, D.J., Fraser, B.J., Rietveld, M.T., Menk, F.W., **Conjugate effects from ground excitation of ULF waves in the ionosphere,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.34-40, 2 refs.

An attempt to observe possible conjugate reception of Pc1 waves produced by modulated ionospheric heating experiments is reported. A number of successful experiments were conducted in 1984 by the Max-Planck-Institut using the Tromsö HF radio transmitters to modulate ionospheric conductivities in the frequency range 0.25 to 8.0 Hz. ULF waves at the modulating frequencies were detected 17 km from the transmitter site. The Newcastle pulsations group operates a ULF induction coil magnetometer at Mawson, the closest station to the conjugate point of Tromsö. Recordings taken at Mawson during the heating experiments have been spectrally analyzed using digital pure state detection techniques to search for conjugate effects. The results obtained and their interpretation are presented. (Auth.)

Kemp, W.J., Fraser, B.J., Webster, D.J., **Ground-satellite studies of Pc1 pulsation propagation,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.41-57, Refs. p.55-57.

The magnetospheric generation and propagation characteristics of ion cyclotron waves associated with Pc1 emission observed on Dec. 16, 1977 between 1540-1615 UT in a frequency band 0.5-0.8 Hz by a network of four middle and low latitude ground stations are determined using ground source location techniques and ISEE-1 plasma data. The Pc1 emission band seen on the ground corresponds to the propagation region between the equatorial O and He characteristic frequencies. With these results it is possible to completely describe the wave generation mechanism and the magnetosphere-ionosphere propagation characteristics for this event. (Auth. mod.)

Voloshinov, N.N., **Morphology of the midday radio aurora in the Southern Hemisphere,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.58-72, 15 refs.

A joint Australian/USSR auroral radar experiment was conducted at Mawson and Davis stations over the austral 1979-80 and 1982-83 seasons, respectively. The experimental technique is described and a statistical analysis of results presented. It is found that: the Southern Hemisphere midday cusp is always above 74 deg corrected geomagnetic latitude; the probability of observation of radio auroras with the southernmost Davis radar is maximum under the projection of the midday cusp and depends on solar illumination conditions; and the probability of radio aurora occurrence in this cusp region displays a weak dependence on magnetic activity. (Auth.)

Phillips, A., Vincent, R.A., **Winds in the middle atmosphere at Mawson, Antarctica: 1. mean circulation and large scale motions,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.86-92, 4 refs.

Winds in the height range 70-110 km have been recorded continuously since July 1984, using the 'partial reflection drifts method' at Mawson Station. This large data-set enables study of the mean circulation and the results can be compared with those from similar high-latitude stations operating in the Northern Hemisphere. Initial results show that there is a high degree of similarity between Mawson and Poker Flat, Alaska, in the zonal components but not as much in the meridional components. Comparisons with recent wind models are also made. (Auth.)

Phillips, A., Vincent, R.A., **Winds in the middle atmosphere at Mawson, Antarctica: 2. Tides,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.93-106, 6 refs.

Winds in the region 70-110 km have been recorded continuously using the 'partial reflection drifts method' at Mawson Station since July 1984. The large, continuous data set allows the study of atmospheric tides. Atmospheric tides at high latitudes are of particular interest because diurnal propagating modes are inhibited, allowing study of non-propagating modes in isolation. Results from Mawson are compared with those from the Poker Flat MST radar at similar latitude in Alaska. (Auth.)

Wardill, P., Jones, N., Jacka, F., **Dynamics of the thermosphere over Mawson, Antarctica: 1. Diurnal variation and geomagnetic dependence,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.114-120, Refs. p.118-120.

A scanning Fabry-Perot spectrometer at Mawson Station was used to measure Doppler shift and broadening of the OI 630 nm emission in the night airglow and aurora. Analysis of these measurements has yielded estimates of neutral thermospheric temperatures and wind velocities in the 200-300 km region. Viewed in geomagnetic coordinates the averaged wind velocities were south-westward (sunward) during the afternoon and evening hours and equatorward (antisunward) around magnetic midnight. Wind speeds ranged from about 100m/s during quiet and moderate geomagnetic conditions up to about 200m/s during disturbed conditions. The results confirm that the principal momentum source in the high latitude thermosphere is ion drag, resulting from the motion of ions in response to the polar electric field pattern. (Auth.)

Jones, N., Wardill, P., Jacka, F., **Dynamics of the thermosphere over Mawson, Antarctica: 2. Dependence on the Y component of the interplanetary magnetic field,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.121-130, 6 refs.

The thermospheric wind signatures that would be expected at a southern auroral zone location for each of the characteristic field geometries are considered, and thermospheric wind data obtained at Mawson Station during 1981, 1982 and 1983 are examined for evidence of them. Some features of the expected signatures are observed in the night-time wind data from 1981 and 1983. More convincing evidence is found in two separate twenty-four hour long continuous wind observations made using the daylight observing capability of the Mawson FPS. (Auth. mod.)

Wardill, P., Jacka, F., **Dynamics of the thermosphere over Mawson, Antarctica: 3. Horizontal divergence of the wind field,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.131-137, 10 refs.

Measurements of the thermospheric neutral wind velocity at Mawson Station frequently reveal large horizontal divergence. The observed wind field at any given time may be decomposed into contributions from a uniform background wind and from a divergent line source oriented along the geomagnetic east-west direction. The calculated motion of the hypothetical line source is in qualitative agreement with that of the auroral electrojet. It is proposed that the electrojet drives a divergent flow via momentum deposition resulting from the dissipation of gravity waves above about 200 km. (Auth.)

K-35967
Jones, N., Jacka, F., **Dynamics of the thermosphere over Mawson, Antarctica: 4. The lower thermosphere,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.138-147, 11 refs.

During the austral spring of 1981, at Mawson Station, measurements were made of the spectrum of the nighttime 558 nm emission from atomic oxygen in the lower thermosphere. The spectra have been analyzed to yield wind and temperature information. The inferred temperature was highly variable. An argument for assigning the emission to the 100-130 km altitude region is presented. The wind, when viewed in the geomagnetic-coordinates/magnetic-local-time frame, was poleward and westward around dusk, equatorward and westward around midnight. The observed winds show excellent qualitative agreement with the predictions of a three-dimensional, time-dependent, global thermospheric numerical model due to Fuller-Rowell and Rees (1980, 1984), which includes the effect of ion drag and a specification of the high-latitude electric field. (Auth. mod.)

Hajkowicz, L.A., Hunsucker, R.D., **Simultaneous observation of large-scale periodic TIDs in both hemispheres following an onset of auroral disturbances,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.187-197, 5 refs.

An onset of an auroral substorm at the equatorward edges of the southern and northern auroral zones preceded the occurrence of periodic variations in the virtual height (h'F) of the F-region in the Southern and Northern Hemispheres. The variations in h'F had characteristics typical of large scale TIDs (LS TIDs) propagating equatorwards with a velocity of about 800m/s, and with a constant period of 135 minutes in both hemispheres. The horizontal wavefront of LS TIDs was observed in mid-latitudes to be in excess of 7000 km. The LS TIDs were found to be in phase at the stations which are equidistant from the auroral sources. From this it was concluded that the periodic LS TIDs were likely to produce a constructive interference effect at the points of their encounter, near the equator. (Auth. mod.)

Lambert, M., Essex, E.A., **Studies of ionospheric irregularities around L=4 in the Southern Hemisphere using satellite beacons,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.198-205, 5 refs.

From Dec. 28 1983 to Mar. 10, 1985 total electron content (TEC) data were gathered from Macquarie I. in the southern auroral zone using the Faraday rotation technique. The beacons on the geostationary satellites ATS-1 and ETS-2 transmitting on 137.35 MHz and 136.112 MHz were used. Preliminary analysis of the data indicates that large scale fluctuations in the TEC occur which are associated with auroral activity. Some of these disturbances propagate towards the mid latitudes with speeds of from 200 to 1000m/s. Large scale rapid decreases in TEC were observed during the evening hours on about one third of the Sep. equinox days studied. These decreases occurred at a geomagnetic latitude assumed 60 S and could be associated with the main ionospheric trough traveling through the ray path from the satellite to the receiving station. (Auth.)

Fraser, B.J., Morris, R.J., **Australia's magnetospheric research in Antarctica,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.236-245, 1 ref.

Antarctica is a very important continent for the study of magnetospheric physics since the polar cap and cusp region provide the most direct connections between ground recording stations and the outer boundaries of the earth's magnetosphere; the auroral zone, situated at slightly lower latitudes than the cusp, is a region of great energy deposition. The Australian antarctic stations are favorably situated to study the physics of these regions. A 5 year program using 5 antarctic stations to study the transport of energy through the auroral and cusp regions by ultra low frequency plasma waves is proposed and involves the Antarctic Division, two universities and international collaboration. (Auth.)

Essex, E.A., **AUSSAT beacon proposal—relevance to antarctic stations,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.246-252, 9 refs.

The second generation AUSSAT (1992 et seq.) satellites provide the Australian upper atmosphere scientific community with the opportunity to re-enter the space age. To this end a proposal for a radio beacon experiment on AUSSAT has been prepared by the Ionospheric Prediction Service, Department of Science, in conjunction with the universities of La Trobe and Monash. The location of the spacecraft in geosynchronous orbit at 156-164 E longitude means that the subantarctic station of Macquarie I. is ideally suited as a ground station. Unless the longitude position is moved further west, the Australian antarctic mainland stations are not suitably located for ionospheric studies using the AUSSAT beacons. Possible ionospheric studies using the AUSSAT beacons are outlined. (Auth.)

Dyson, P.L., **Polar cap ionosphere,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.253-257, 4 refs.

A proposal is presented for the establishment of a modern digital ionosonde at Casey Station, which would provide an excellent means of studying the ionosphere in the polar cap region, information on the state of the ionosphere to aid the interpretation of optical and magnetic measurements, and a means of studying auroral phenomena during daylight hours.

K-35979
Wilkinson, P.J., **SUNDIAL campaigns,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Apr. 1987 No.48, p.258-262.

SUNDIAL is the name chosen for a series of campaigns which will improve understanding of the solar terrestrial environment. An outline of a co-ordinated campaign to develop a real-time prediction capability for the ionosphere is presented. The contributions antarctic stations can make to this program are noted. (Auth. mod.)

K-36044
Rycroft, M.J., **Strange new whistlers,** *Nature,* June 4, 1987 327(6121), p.368-369, 15 refs.

Whistlers are radiowaves of audio frequency whose source is an almost instantaneous lightning discharge. Such whistler-mode waves are guided through the magnetosphere from one hemisphere to the other by ducts of enhanced plasma density, which are aligned along geomagnetic field lines. On page 405 of this issue, (see K-36045) Armstrong reports a strange new phenomenon—the apparent triggering of one whistler by an identical one occurring about 5 seconds earlier. Armstrong considers the likelihood of this type of event statistically and concludes that it is not a chance coincidence. Following a short discussion of how whistlers act in the atmosphere and their close relationship to thunderstorms, the one-hop whistlers of Armstrong's article are examined and explained.

K-36045
Armstrong, W.C., **Lightning triggered from the Earth's magnetosphere as the source of synchronized whistlers,** *Nature,* June 4, 1987 327(6121), p.405-408, 44 refs.

Specific patterns established by natural radio signals echoing periodically in a magnetospheric whistler duct are sometimes observed to indicate strongly preferred times at which identical, well-defined whistlers occur. Ordinarily such whistlers would be assumed to originate in the stronger ground strokes of spontaneous lightning. These nonrandom whistlers are therefore unexpected and raise the possibility that some whistler-source discharges may be triggered from the magnetosphere. The same possibility could also be predicted independently from another type of recent observations. Selected examples of nonrandom whistlers are given here and the supporting observations described. In the absence of a previously developed theoretical explanation, a trigger mechanism is outlined which emphasizes discontinuous discharge to the upper atmosphere. Such a mechanism might help explain several related phenomena. Examples shown are from data recorded at Siple Station. (Auth.)

Ejiri, M., ed, **Proceedings of the Ninth Symposium on Coordinated Observations of the Ionosphere and the Magnetosphere in the Polar Regions, 1986,** *Tokyo. National Institute of Polar Research. Memoirs,* Mar. 1987 No.47, 224p., For selected papers see G-36057, G-36064, I-36059, I-36060, K-36056, K-36058, and K-36061 through K-36063.

The symposium consisted of the following ten sessions: 1) ionospheric and magnetospheric disturbances in the polar regions, 2) auroral dynamics, 3) sounding rocket observations, 4) satellite observations, 5) sounding balloon observations, 6) geomagnetic disturbances associated with storm sudden commencements and substorms, 7) geomagnetically conjugate observations, 8) Middle Atmosphere Program (MAP) in Antarctica, 9) ELF, VLF and HF wave phenomena, and 10) solar wind-magnetosphere-ionosphere interactions. The present volume contains 22 scientific papers selected from 83 individual contributions presented at the symposium. These papers are classified into 4 groups: observational results of sounding rockets and balloons operating at high latitudes; results of the MAP (Middle Atmosphere Program); conjugate phenomena at Showa Station and Iceland; and ULF-VLF waves in the polar and the lower latitude regions as well as their propagation and generation mechanisms. (Auth. mod.)

Ejiri, M., Hirasawa, T., Ono, T., Oguti, T., **Auroral images and particle precipitations observed by the sounding rocket experiment at Syowa Station,** *Tokyo. National Institute of Polar Research. Memoirs,* Mar. 1987 No.47, Symposium on Coordinated Observations of the Ionosphere and the Magnetosphere in the Polar Regions, 9th, 1986, edited by M. Ejiri, p.1-21, 23 refs.

Three sounding rockets were launched in 1984 from Showa Station into different types of aurora, designated as AURORA I (an active auroral arc at the substorm expansion phase), II (a stable arc prior to the substorm onset) and III (a diffuse aurora during the recovery phase). A new low-light-level television camera was also used to take an auroral picture downwards from the spinning rocket, together with the electrostatic quadrispherical and magnetic electron spectrometers to measure the energy spectrum of auroral particles (electrons). AURORA I showed greater values in both auroral emission and electron density than AURORA II. In AURORA III, although the auroral emission intensity was much less in comparison with AURORA I, the electron density showed a pronounced enhancement in the *D* region and was comparable to AURORA I above the *E* region. The electron temperatures for the 3 cases do not differ much and are quite similar to one another below 150 km in altitude. As for an energy spectrum of auroral electrons, AURORA I and II showed an inverted-V type monoenergetic peak with much greater energy for AURORA I than for AURORA II, whereas AURORA III exhibits a power-law spectrum with a small superposing monoenergetic peak around 0.5 keV above 200 km in altitude. Iversen, I.B., **Preliminary results from the auroral zone ionosphere observations during the AZCO balloon campaign in 1985,** *Tokyo. National Institute of Polar Research. Memoirs,* Mar. 1987 No.47, Symposium on Coordinated Observations of the Ionosphere and the Magnetosphere in the Polar Regions, 9th, 1986, edited by M. Ejiri, p.36-43, 16 refs.

In July 1985 a joint Japanese-Danish-Norwegian balloon campaign for auroral zone conjugate observations (AZCO) was carried out. The campaign complemented measurements at Japanese geophysical stations in Iceland and in Antarctica. The instrumentation on the ground included magnetometers, riometers, and VLF detectors in both conjugate areas and also back-scatter radar and auroral monitors in the South. The balloons were equipped with detectors for X rays, electric fields, and VLF electromagnetic emissions. This report is preliminary as the data have not been reduced thoroughly yet. Information has been obtained about particle injection during substorms and the connection between ionospheric electric and magnetic fields. (Auth.)

Nagano, H., **Geomagnetic sudden commencements observed at the Syowa-Iceland conjugate stations,** *Tokyo. National Institute of Polar Research. Memoirs,* Mar. 1987 No.47, Symposium on Coordinated Observations of the Ionosphere and the Magnetosphere in the Polar Regions, 9th, 1986, edited by M. Ejiri, p.78-91, 19 refs.

In order to clarify characteristics of geomagnetic sudden commencements (SCs) at geomagnetically conjugate stations, 6 SC events were analyzed by the use of digital magnetic data at Showa Station in Antarctica and Husafell, Isafjördur and Tjörnes in Iceland from Sep. 1984 to Jan. 1985. SC polarization, waveforms and SC-associated pulsations are examined between the conjugate stations, and the char-

acteristics are discussed in comparison with a model suggested for the latitudinal reversal of SC polarization in high latitudes on the ground. (Auth.)

Kato, Y., Tonegawa, Y., **Pi 1 pulsations associated with substorms and their conjugate behavior,** *Tokyo. National Institute of Polar Research. Memoirs,* Mar. 1987 No.47, Symposium on Coordinated Observations of the Ionosphere and the Magnetosphere in the Polar Regions, 9th, 1986, edited by M. Ejiri, p.92-96.

Short period geomagnetic pulsations associated with substorms in the frequency range from about 0.1 to 0.4 Hz are investigated using the dynamic spectrum analysis technique, and it was found that these Pi 1 pulsations are excited simultaneously with Pi 2 pulsations and they show a clear conjugate behavior. These results suggest that Pi 1 pulsations might be ion-cyclotron waves generated in the geomagnetic tail due to a drastic change of geomagnetic field configuration in the course of a substorm. He, C., Tschu, K., **Preliminary studies on the whistler observation of Great Wall Station of China, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Mar. 1987 No.47, Symposium on Coordinated Observations of the Ionosphere and the Magnetosphere in the Polar Regions, 9th, 1986, edited by M. Ejiri, p.148-156., 10 refs.

During the First Chinese National Antarctic Research Expedition 1984/85, observation on whistler and VLF emission was carried out by using GM type VLF broadband direction-finding receiver. The morphology of whistlers received shows 2 peaks of their activity at 17-20 LT and at 03-06 LT. Whistler dispersion is greater during sunset and less after midnight. Detailed analysis of whistler data of Jan. 23 and 26 at Great Wall Station reveals that the dispersions of whistlers propagating in different shells markedly decrease on the day of geomagnetic storm commencement (Jan. 23). It implies a rapid depletion of the electron density in the shells. There is a downward flux of electron of 1 billion el/sq cm s. A steady refilling process occurs in shells of L=2.8-2.9, 3 days after the storm on Jan. 26. Whistler direction-finding data obtained on Jan. 20 show that the exit points of the whistlers are situated in a strip of about 80 km wide in longitudes with an azimuthal direction 20-40 deg E of N between 48-52 deg geomagnetic latitude, and there are no obvious cross L or longitudinal drifts. Whistler data at great Wall Station are very useful for deducing temporal and spatial variations of electron density in L=2-3 shells and investigating particle interchange processes between the ionosphere and the plasmasphere. Niedner, M.B., Jr., Liller, W., **IHW Island Network,** *Sky and telescope,* Mar. 1987 73(3), p.258-263.

The International Halley Watch Island Network grew out of the need for additional coverage of Halley's comet from the Southern Hemisphere. The idea was to place portable Schmidt cameras on remote islands to monitor the comet. Since funds were available only to purchase the equipment, one of the most difficult aspects of the program was finding volunteers to operate the cameras. After considerable effort, the final sites selected were Tahiti, Easter I., the British Antarctic Survey's Faraday Station on the Antarctic Peninsula, the South African Astronomical and Cedarberg observatories, and Reunion I. The equipment at each site is described together with the transport of the equipment.

Morris, R.J., Cole, K.D., **"Serpentine emission" at the high latitude antarctic station, Davis,** *Planetary and space science,* Mar. 1987 35(3), p.313-328, 18 refs.

Almost a decade has passed since Gul'elmi and Dovbnya (1974) introduced the high latitude class of ultra low frequency pulsations known as "Serpentine Emission" (SE). The purpose of this paper is twofold; firstly, to present new morphological results of SE observed at Davis Station and, secondly, to stimulate further experimental and theoretical interest by pulsation researchers. Analyses presented include the first cited amplitude-time structure of SE along with maximum entropy power spectra and digital sonagrams. SE polarizations are investigated and a limited diurnal morphological survey is presented. (Auth.)

Iijima, T., Shibaji, T., **Global characteristics of northward IMF-associated (NBZ) field-aligned currents,** *Journal of geophysical research,* Mar. 1, 1987 92(A3), p.2408-2424, Refs. p.2423-2424.

Global characteristics of large-scale field-aligned current (FAC) systems have been determined by analyzing the magnetic disturbances acquired with the MAGSAT satellite in the southern summer hemisphere during Nov. 1979 through Jan. 1980 for the 3 cases of the IMF Bz>By>0, IMF By>Bz>0, and IMF By>0 and Bz<0. Transverse magnetic disturbances having a half wave-length larger than 113 km at the MAGSAT altitudes in the range of about 350 to about 550 km were subjected to the present analysis. The global distribution was limited by the MAGSAT orbits over the south pole to latitudes above about 83 deg ML (magnetic latitude) on the dayside and above about 71-72 deg ML on the nightside. The large-scale FAC systems include the usual region 1 and 2 systems and the recently found NBZ system. The NBZ system denotes the FACs which flow into and away from the polar cap ionosphere (poleward of the region 1 system) during periods of the IMF Bz>0. The conclusions from this study are the continuous transition in the FAC pattern (NBZ + region 1 + region 2 systems) from IMF Bz>0 to IMF Bz<0 and the disconnection between the dayside and the nightside parts of these FAC systems. (Auth. mod.)

Rosenberg, T.J., Dudeney, J.R., **Local time, substorm, and seasonal dependence of electron precipitation at L = 4 inferred from riometer measurements,** *Journal of geophysical research,* Nov. 1, 1986 91(A11), p.12,032-12,040, 33 refs.

DLC QC811.J6

The variations of electron precipitation at L = 4 as inferred from riometer measurements of cosmic radio noise absorption made during 1975 at Siple Station and Halley Bay were examined. The results are presentcd in the form of annual and seasonal averages of 1/2-hourly values for two geomagnetic activity subsets, AE>140 nT (disturbed) and AE<140 nT (quiet). Monthly quiet day curves were used to remove the diurnal and seasonal variations in the background noise levels. Generally, the local time characteristics of the absorption were the same at both stations; the highest absorption occurred in the 0400-1600 MLT sector during disturbed conditions and in the 1200-2000 MLT sector during quiet conditions. For high AE, the highest correlation was obtained at a lag equal to the magnetic local time difference (1.5 hours) between the two stations. On the other hand, for low AE, the highest correlation occurred for a lag of 3.0 hours, nearer the local solar time difference (3.8 hours). Consistently higher absorption was measured at Halley on the average during both levels of magnetic disturbance and in all seasons. At both locations, and for both geomagnetic activity subsets, more absorption was observed in summer and equinox than in winter. (Auth. mod.)

Vovk, V.IA., Byn'ko, I.G., **Radio wave propagation over the Moscow-Antarctica path** [O traektoriiakh rasprostraneniia radiovoln na trasse Moskva-Antarktida], *Sovetskaia antarkticheskaia ekspeditsiia. Trudy,* 1986 No.81, p.78-86, In Russian. 4 refs.

Possible paths of radiowave propagation are derived from experimental oblique sounding and the distribution of angular parameters measured on the Moscow-Molodezhnaya trajectories in July-Dec. 1979. The possibility of radio wave reception through the back side of the Earth is considered. The best time for such "backside" signals is just before sunset during the equinoctial periods.

Saito, H., Yoshino, T., Sato, N., **Narrow-banded ELF emissions over the southern polar region,** *Planetary and space science,* June 1987 35(6), p.745-752, 8 refs.

Narrow-banded ELF emissions in the frequency band of 100-500 Hz have been observed in the VLF data received at Showa Station from *ISIS* 1 and 2. The occurrence distributions of narrow-banded ELF emissions over the southern polar region have been studied statistically. It is found that emissions mostly occurred in the evening 17-24 M.L.T. sector and in the region of 65-75 deg invariant latitude associated with V-shaped VLF hiss emissions. The emissions are correlated with disturbed geomagnetic activity and the occurrence region shifts to lower latitude in association with increased geomagnetic activity. It is also found that emissions maximize during austral winter season, from Apr. to July. The emission frequencies are strongly dependent on the satellite's altitude. These results suggest that narrow-banded ELF emissions are excited in the topside ionosphere by upflowing ion or downflowing electron fluxes and that the growth rate strongly depends on the ambient electron density. The relation between the emissions observed by the satellite and on the ground is also discussed. (Auth.)

Tulunay, Y.K., Grebowsky, J.M., **Hemispheric differences in the morphology of the high latitude ionosphere measured at about 500 km,** *Planetary and space science,* Jule 1987 35(6), p.821-826, 5 refs.

Ambient electron density measurements made by the radio frequency capacitance probe on *Ariel* 4 have been analyzed in order to study the structures present at about 500 km altitude at high latitudes during the 1971 Northern Hemisphere winter (Dec. solstice) and the 1972 Southern Hemisphere winter (June solstice); data obtained on 94 days centered on each solstice have been used. The general morphology of and the extreme densities within the mid-latitude electron density trough, the polar cap depletions and the electron density enhancements associated with the cusp-auroral zone were determined statistically. Analyses of data acquired during quiet magnetic conditions show that the Northern and Southern Hemisphere winter ionospheres were significantly different; in particular, the Southern Hemisphere densities were lower than those in the Northern Hemisphere. The maximum electron densities observed in the Northern Hemisphere occurred in a magnetic-local-time range symmetrical about the 02-14 M.L.T. meridian, whereas in the Southern Hemisphere the maxima were symmetrical with respect to the midnight-noon magnetic meridian. Bol'shakova, O.V., **Long-period geomagnetic pulsations in high-latitude magnetically conjugate regions,** *Geomagnetism and aeronomy,* Aug. 1986 26(1), p.136-137, Translated from Geomagnetizm i aeronomiia. 6 refs.

An analysis was made of the conjugate nature of pulsations using the method of direct comparison of the magnetograms of two high-latitude observatories of the northern and southern hemispheres in 1977: Sundrestrom Fjord and South Pole. Examples of symmetrical and asymmetrical appearance of long-period pulsations in the northern and southern hemispheres near the daytime polar cusp are presented. It is concluded that by studying the geomagnetic pulsations at conjugate points in a fixed high-latitude interval, it is possible to judge the structural changes and asymmetry of the high-latitude magnetosphere from the degree to which they are conjugate.

Rosenberg, T.J., **Coordinated ground and space measurements of an auroral surge over South Pole,** *Journal of geophysical research,* Oct. 1987 92(A10), p.11,123-11,132, 29 refs.

The surge produced a rapid onset of cosmic radio noise absorption at the station. On the polar-orbiting DMSP F6 spacecraft, intense X ray emissions with E>2 keV energy were imaged 1 deg to 2 deg magnetically equatorward of South Pole approximately 1 min prior to the peak of the absorption event. The spectrum of precipitating electrons determined from the X ray measurements could be characterized by an e-folding energy of ~11 keV and is adequate to account for the cosmic noise absorption and maximum auroral luminosity recorded at South Pole. Photometer, all-sky camera, riometer, and magnetometer data are used to estimate the velocity of motion and spatial extent of the auroral precipitation and the ionospheric currents associated with the surge. Details of the measurements are discussed. (Auth. mod.)

Pomerantz, M.A., **Astronomy on ice,** *Astronomical Society of Australia. Proceedings,* 1986 6(4), p.403-415, Refs. p.414-415.

The geographic South Pole, where the United States maintains a year-round scientific station, affords continuous viewing and constant declination of all objects in the southern celestial hemisphere, under conditions of exceedingly low humidity, extended periods of coronal seeing, high altitude, and uniform terrain. The areas of research that have already benefited immensely from these extraordinary features, such as helioseismology and submillimeter astronomy, are reviewed. Unparalleled observations of global solar oscillations have already yielded significant information about the structure and dynamics of the Sun's interior. Far infrared measurements of various galactic and extra-galactic regions have attained an unprecedented level of sensitivity, limited for the first time only by the noise inherent in the detector. In addition to further helioseismological observations, currently planned future activities include observational cosmology and ultra high energy gamma ray astronomy. (Auth.)

Suzuki, H., Sato, N., **Seasonal and diurnal variations of ELF emission occurrences at 750-Hz band observed at geomagnetically conjugate stations,** *Journal of geophysical research,* June 1, 1987 92(A6), p.6153-6158, 12 refs.

Statistical characteristics of emission occurrence are examined, using digital data of 750-Hz intensity records obtained at the conjugate pair of stations, Showa Station in Antarctica and Husafell in Iceland. The following notable diurnal and seasonal variations were found: (1) emissions were mostly observed during the daytime in the conjugate region; emission occurrence rate reached maximum at Husafell 2-3 hours later than at Showa. (2) Seasonal variations of emission occurrence showed the same tendency at the conjugate stations. Emission intensities showed a maximum during local summer and a minimum during local winter in both hemispheres. The ratio of average emission intensity in each season to the intensity in winter is approximately 2.1-2.2 for summer, 1.7-1.9 for autumn and 1.7 for spring. From these statistical characteristics, ELF emission intensity appears to depend strongly on not only magnetic local time but also geographic local time and season, suggesting that ELF emissions observed on the ground are firmly controlled by sunlight effects. Sunlight may affect the asymmetry of wave duct enhancement and wave propagation from the magnetosphere to the ionosphere in both hemispheres. Other effects are also discussed in this paper. (Auth.)

K-36337

Sato, N., Kokubun, S., Saemundsson, T., **Geomagnetic conjugacy of 30-kHz band auroral hiss emissions observed at L=6.1,** *Journal of geophysical research,* June 1987 92(A6), p.6159-6162, 17 refs.

Statistical characteristics of auroral hiss emissions in the 30-kHz band were examined using the data observed simultaneously at the Showa-Husafell conjugate pair of stations during the period of Sep.-Nov. 1983. The occurrence probabilities of conjugate events observed simultaneously at the two stations were almost the same in Sep. and Oct. and decreased during Nov. These phenomena were mostly observed during 1700-2300 MLT around the geographic midnight at Showa. On the other hand, the number of nonconjugate phenomena detected only at Husafell in Iceland increased from Sep. to Nov. The occurrence peaks were around 2100-0200 MLT, before geographic midnight at Husafell. From these statistical characteristics it appears that auroral hiss emission occurrences strongly depend on not only the magnetic local time but also the geographic local time and season, suggesting that auroral hiss emissions observed on the ground are strongly controlled by sunlight effects in the topside ionosphere. Wrenn, G.L., Rodger, A.S., Rishbeth, H., **Geomagnetic storms in the antarctic F-region. I. Diurnal and seasonal patterns for main phase effects,** *Journal of atmospheric and terrestrial physics,* Sep. 1987 49(9), p.901-913, 28 refs.

New analysis procedures are used to show that the main phase mid-latitude storm effects conform to consistent patterns in local time when suitable selection rules are applied, with averaging over several years. Changes in *foF2,* with respect to estimated quiet-time values, are analyzed in terms of a new geomagnetic index derived to take account of integrated disturbance. Reduction of *foF2,* is greatest during the early morning hours, in summer, at higher geomagnetic latitudes, near solar minimum and through the more active periods. The various dependencies are quantitatively determined for the first time by creating an average 'steady state' disturbance, rather than following specific storm events. This approach will permit tests of competing theories using available modelling programs. (Auth.)

Voloshinov, N.N., Troshichev, O.A., **Effects of interplanetary magnetic field on the distribution of radioaurora in the southern polar cap,** *Planetary and space science,* Mar. 1986 34(3), p.307-314, 13 refs.

DLC QC801.P5

The analysis of the spatial distribution of the radioaurora in the southern polar region carried out on the basis of radar observations at Davis Station shows the following: perfect aspect conditions typical of Davis Base make it possible to see the radioaurora in the latitude range phi prime=76-84 at any time of a day. Probability of radioaurora occurrence is maximum (up to 100%) in the daytime cusp region, that is at the latitudes phi prime=78-79 when Bz<0 and phi prime=79-80 when Bz>0. Maximum of radioaurora occurrence is displaced towards morning hours when Bz<0, By<0 or Bz>0, By>0 and toward evening hours when Bz<0, By>0 or Bz>0, By<0. The displacement of radioaurora into the morning or evening sector may be considered as a result of redistribution of the electric field intensity in the dayside polar cap when affected by the IMF Bz and By components. Sokolov, S.N., Ul'ev, V.A., **Applicability of VLF phase observations on transpolar paths to observations of polar cap absorption** [Ispol'zovanie nabliudeniĭ fazy SDV na transpoliarnykh trassakh dlia kontrolia PPSh], *Akademiia nauk SSSR. Mezhduvedomstvennyĭ geofizicheskiĭ komitet. Magnitosfernye issledovaniia,* 1987 No.9, p.88-93, In Russian with English summary. 12 refs.

Several solar proton events (SPE) in 1978-1981 registered from observations of the phase anomalies of the VLF-transmitter signals of the Omega radionavigation system over extended transpolar paths and from the data of riometric and satellite measurements, some obtained at Vostok Station, are analyzed. A relationship between the decrease in the ionospheric waveguide effective height (under condi-

tions of a one-mode propagation) and the riometric absorption logarithm at lighted stations in the northern and southern polar caps is obtained empirically. The relationship turns out to be linear. A high correlation of these values variations on the stage of the SPE depression allows VLF-wave observations on a one-mode propagation line to be used when estimating the IMF value at the highest latitudes in the polar cap. The phase observations could be applied in evaluating an integral proton flux associated with the riometric absorption. The riometric data could be used in correcting the VLF wave phase variations on the transpolar lines at the high latitudes in the course of the SPE. It is shown that the simultaneous phase observations on two or more transpolar lines with one-mode propagation allow to estimate a position of the equatorial edge of the disturbed ionospheric region in the course of the SPE. Phase observations allow us as well to perform earlier detection of the beginning of the solar proton precipitation to the polar cap region, compared to riometers. (Auth.)

Yamagishi, H., **Upper atmosphere physics data, Syowa Station, 1985,** *Japanese Antarctic Research Expedition. JARE data reports,* July 1987 No.128, 272p., 5 refs.

The report summarizes upper atmosphere physics data by the *Upper Atmosphere Physics Monitoring System* at Showa Station in 1985. The items of observations are as follows. Geomagnetism: H-, D- and Z-components of magnetic variations, total force of the geomagnetic field, H-, D- and Z-components of magnetic pulsations. ELF-VLF wave: intensities at 0.35, 0.75, 1.2, 2, 4, 8, 30, 60 and 95 kHz, wide-band signal of ELF-VLF emissions. Ionosphere: cosmic noise absorption at 30 MHz. Aurora: meridian scanning record of OI 5577 Å and H(beta) 4861 Å, auroral intensity of 1NG N2+ 4278 Å at three directions (30 deg poleward, zenith and 30 deg equatorward). An outline of the monitoring system, instrumentation and data format, and the format of the compiled digital data are included. Appendix 1 presents daily continuous computer plots of magnetograms of Showa from Jan. 1 through Dec. 31, 1985. Appendix 2 presents frequency-time spectra of the H-component of magnetic pulsations in 1985.

Sonett, C.P., Morfill, G.E., Jokipii, J.R., **Interstellar shock waves and Be-10 from ice cores,** *Nature,* Dec. 3, 1987 330(6147), p.458-460, 22 refs.

The anomalously high concentrations of Be-10 in antarctic ice cores, uncorrelated with delta O-18, are consistent with an increase in the atmospheric cosmic ray (CR) flux from CR acceleration in propagating interstellar shock waves, which envelop the heliosphere and whose source may be ancient supernovas. This mechanism is an alternative to the model where decreases in geomagnetic field intensity, associated with geomagnetic reversals, periodically enhance the CR flux at the top of the atmosphere. That CR variations attributable to interstellar events such as supernova shock waves have so far not been observed in the CR record is a long-standing issue. If the interpretation of the Be-10 spikes is correct, it marks the first such observation. The possibility that 'direct' observation of the interstellar medium can be made using the Be-10 record would be an important adjunct to the study of cosmic rays in the interstellar medium. (Auth.)

Ono, T., **Aurora observations at Syowa Station in 1984,** *Polar news,* July 1985 No.41, p.19-23, In Japanese.

The 25th JARE party made a comprehensive auroral observation during the winter in 1984 using ordinary and advanced observation systems. The all sky camera (ASC) at Showa Station gives one of the highest quality of all sky films among auroral observatories in the world using a fish eye lens with F=1.4. The ASC observation was started on Feb. 25 and ended on Oct. 13, 1984. Photometric observations were carried out by using fixed directional photometers and scanning photometers at wavelengths of 4278 Å, 5577 Å and 4861 Å. All sky auroral images were observed by a highly sensitive panchromatic TV camera. These TV images were found to be very useful for a monitor of auroral activity especially for auroral experiments such as sounding rockets. Monochromatic auroral images were successfully observed by using a charge coupled device TV camera at principal auroral emission lines such as 6300 Å (OI), 5577 Å (OI), 4861 Å (Hbeta) and 4278 Å (1N N2+). Obtained data were recorded in digital form according to a PCM format. Photographs and diagrams of some of the instruments are included.

Ejiri, M., **Rocket shooting into aurora australis in 1984,** *Polar news,* July 1985 No.41, p.24-28, In Japanese.

Three sounding rockets were launched in 1984 from Showa Station into different types of aurora, designated as AURORA I (an active auroral arc at the substorm expansion phase), II (a stable arc prior to the substorm onset), and III (a diffuse aurora during the recovery phase). A new low-light-level television camera was used to take an auroral picture downwards from the spinning rocket, together with electrostatic quadrispherical and magnetic electron spectrometers to measure the energy spectrum of auroral particles. The instrument design of scientific payloads, launching operations and rocket flight performance records as well as preliminary results are presented.

Sato, N., ed, **Proceedings of the Nagata Symposium on Geomagnetically Conjugate Studies and the Workshop on Antarctic Middle and Upper Atmosphere Physics,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, 325p., Refs. passim. For individual papers see I-36643 through I-36646, K-36630 through K-36642 and K-36647 through K-36651.

This volume consists of 22 papers presented at a symposium and workshop held in San Diego, California, from June 16 to 20, 1986, as a part of the XIX SCAR Meeting. The papers emphasize the importance of the observation of geomagnetic conjugacy in high latitudes, which gives useful information on the acceleration mechanism for auroral particles and generation and propagation mechanisms for plasma waves in the magnetosphere, with recent results observed at conjugate-pair ground stations such as Showa-Iceland, Siple-Quebec and South Pole-Frobisher Bay, onboard Geos-I and -2 satellites, and results of simulation studies for thermospheric behaviors in the Northern and Southern Hemispheres. Discussion on geospace phenomena covers recent results of auroras, cosmic noise absorption, balloon observation, particle precipitations, and the Middle Atmosphere Program in Antarctica, especially the ozone depletion. (Auth. mod.)

Nagata, T., **Research of geomagnetically conjugate phenomena in Antarctica since the IGY,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.1-45, Refs. p.42-45.

The geomagnetically conjugate relationship studies of the magnetospheric phenomena between the southern auroral zone in Antarctica and the northern auroral zone over Europe and America are historically reviewed, starting with the IGY (1957-1958) results and then summarizing key results obtained by the international cooperative research programs such as the IGC (1959), the IQSY (1964-1965), and IASY (1967-1971) and the IMS (1976-1979). The observed conjugate magnetospheric phenomena are divided into 3 topics according to the physical guiding processes for their conjugacy characteristics: auroral particle precipitation by field-line guidance, resulting in visual auroras, auroral X-rays, cosmic noise absorption (CNA) by the ionosphere and polar magnetic substorms; field-aligned propagation of whistler-mode plasma waves, which cover the ELF and VLF magnetospheric plasma waves that are often bouncing along the field lines between the conjugate ionospheric areas; and the hydromagnetic resonance system of the earth's magnetosphere, which covers most parts of the conjugate characteristics of Pc 3-5 hydromagnetic waves. Ono, T., **Temporal variation of the geomagnetic conjugacy in Syowa-Iceland pair,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.46-57, 18 refs.

The locations of geomagnetically conjugate points of Showa and Iceland were examined by using geomagnetic field models with internal and external magnetic fields. A large secular excursion of the magnetic conjugate point was shown from 1960 to 1990 by tracing the IGRF geomagnetic field lines. The conjugate point of Showa Station moved from a south-west area to a middle-north region in Iceland during the last 30 years. The seasonal and daily variations of conjugate points show that the excursion of the conjugate footpoint is minimum around midnight in equinox seasons and maximum around summer and winter solstice seasons. (Auth.)

Sato, N., Saemundsson, T., **Conjugacy of electron auroras observed by all-sky cameras and scanning photometers,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.58-71, 16 refs.

Simultaneous auroral observations were carried out at the Showa-Husafell conjugate pair of stations Aug. 28-Sep. 30, 1984. The following conjugate auroral data were obtained on 4 nights of clear sky: auroral breakups occur almost simultaneously in the Northern and Southern Hemispheres; the poleward expansion speed is much larger at Showa than at Husafell; the east-west (EW) aligned auroral arcs appear at almost the same geomagnetic latitude in the IGRF model in both hemispheres; the EW-aligned auroras observed at Husafell show a large longitudinal displacement (more than 300 km westward) relative to those observed at Showa; isolated north-south aligned auroras show a good conjugacy in their shapes and locations; and the EW-aligned auroras generally show different movements and fine structures in the two hemispheres. (Auth. mod.)

Fujii, R., **Conjugacy of rapid motions and small-scale deformations of discrete auroras by all-sky TV observations,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.72-80, 16 refs.

Simultaneous observations of discrete auroras were made on Sep. 26, 1984 by means of all-sky TV cameras at a geomagnetically conjugate pair of sites: Showa Station and Husafell. Before the onset of a small substorm conjugate faint discrete auroras were identified in both conjugate areas despite a small displacement (0.5 deg) in invariant latitude (the southern aurora is 0.5 deg higher than the northern); a striking dissimilarity of the conjugate auroras is noted in small-scale structures within the auroras, the northern discrete aurora being rather homogeneous and the southern being a rayed one; during the substorm the east-west movement and/or extension of discrete auroras was quite conjugate and simultaneous; the vortex-like structures such as folds on the discrete auroras were not always simultaneously observed at both places; even if they appeared simultaneously, their sizes seemed to be different between the conjugate regions, suggesting that the large-scale structures and their movements are mainly controlled by some conditions in the magnetosphere, perhaps near the equatorial region, but the small-scale structures such as vortices are greatly due to local acceleration processes between the magnetosphere and the ionosphere. (Auth.)

Helliwell, R.A., **VLF wave injection, experiments from Siple Station, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.81-92, 17 refs.

The background of VLF wave-particle experiments from Siple Station, including wave-induced precipitation, is briefly reviewed. Single frequency ducted signals that exceed a certain 'threshold' intensity are observed at the conjugate point (Roberval, Quebec) to be amplified 30-50 dB, with temporal growth rates of 30-200 dB/s. Following saturation, variable frequency emissions are triggered. When a second signal is added to the first, with a frequency spacing $Df < 100$ Hz, signal growth is reduced and sidebands are generated at frequencies separated from the carriers by integer multiples (up to 7) of Df. The sidebands are attributed to short emissions triggered by the beats between the two input carriers. Mid-latitude magnetospheric hiss is crudely simulated by a sequence of 10 ms pulses whose frequencies are chosen randomly within a 400 Hz band. Results show that certain combinations of 10 ms pulses link together to form chorus-like elements, suggesting a common origin for hiss and chorus. Under conditions of strong echoing, emissions may form into lines; a recent example, started by the Siple Station transmitter, exhibits interline spacings of about 45 Hz. (Auth. mod.)

Gendrin, R., **Magnetic conjugacy as observed at the apex of field lines: Geos-1 and -2 results,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.93-120, Refs. p.116-120.

This article deals with the relationships which exist between phenomena occurring at the apex of field lines, as detected by the European spacecraft Geos-1 and -2, and those occurring at their foot prints, as observed by ground-based balloons and rocket (GBR) techniques. Such simultaneous observations have allowed to obtain a more quantitative description of already known phenomena and to discover some new ones. The following topics are discussed: generation and propagation characteristics of ion cyclotron waves (ICW) in multi-component plasmas, quasi-linear interaction between VLF hiss and energetic electrons, cold plasma behavior in the equatorial plasmasphere and its relationship with the global magnetospheric convection, existence of small-scale intense field-aligned currents (FAC). Rees, D., Fuller-Rowell, T.J., **Hemispheric asymmetries in thermospheric structure and dynamics,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.134-160, Refs. p.158-160.

Viewing the earth from a satellite, the longitudinal and universal time variations of the thermosphere and ionosphere are far more spectacular in the southern polar thermosphere and ionosphere than in the northern polar regions. The southern polar cusp is a localized region of intense forcing with a diurnal migration in geographic latitude from 55 deg to the southern geographic pole. At times of major geomagnetic disturbances, the combination of the equatorward expansion of the auroral oval and the greater offset of the southern geomagnetic pole from the rotational pole causes dramatic effects in southern mid-latitude and near-equatorial regions. A survey of recent satellite data is presented, highlighted by simulations using a global theoretical model, to demonstrate the causes of these hemispheric asymmetries. Future complementary ground-based and space measurements can exploit the hemispheric asymmetries to clearly identify geomagnetic forcing mechanisms. The greater UT and latitudinal modulation in the Southern Hemisphere may be used to identify sub-auroral excitation of the thermosphere and ionosphere during major storms. (Auth. mod.)

Rosenberg, T.J., **Cosmic noise absorption at South Pole and Frobisher Bay: initial results,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.161-170, 5 refs.

A 30 MHz riometer was installed at Frobisher Bay, Canada, in July 1985 to enable conjugate studies of cosmic noise absorption (CNA) phenomena to be performed in conjunction with observations from Amundsen-Scott South Pole Station. The riometer data reveal a variety of temporal associations between disturbances appearing in opposite hemispheres which are generally consistent with observations at these sites reported previously; fluxgate magnetometer data from both locations aid in interpreting the observed phenomena. In particular, absorption events and intense electrojet currents in the dusk sector were found to occur preferentially in one hemisphere (mainly at the South Pole during the period July-Sep. examined here). Because the magnetometer can sense the presence of electrojets far from its immediate vicinity, these cases appear to be evidence of nonconjugate electron precipitation (perhaps occurring on open field lines) or of the severe distortion of the magnetic field line topology in this local time region. Absorption in the noon sector is characterized by long-period modulations in the Pc 5-6 range. (Auth. mod.)

Krishnaswamy, S., Rosenberg, T.J., **Modulated ionospheric absorption unaccompanied by signficant geomagnetic pulsations,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.171-182, 15 refs.

Long-period (Pc 4-5) modulations of ionospheric cosmic noise absorption (CNA) at Siple Station are rarely seen unaccompanied by pulsations in the local geomagnetic field. Conjugate modulations of about 2 min period lasting about one hour were recorded near local noon by riometers at Siple and Roberval on Oct. 30, 1983. The Siple magnetometer records show little evidence of pulsations at this time. The absence of a ground magnetic signature implies that if such events are caused by ULF hydromagnetic waves (e.g., a field line resonance), the waves are highly localized and effectively screened by the ionosphere. In addition, the possible existence of a recurrent particle precipitation structure in space was suggested by observations of absorption modulations with periods of 10-15 min which occurred on several days at about the same time of day. These modulations were also generally unaccompanied by magnetic pulsations. (Auth.)

Smith, A.J., **Whistler mode signals from VLF transmitters, observed at Faraday, Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.183-195, 26 refs.

The Doppler shift, one-hop group travel time and arrival direction of whistler mode signals from the NAA (24 kHz) and NSS (21.4 kHz) VLF transmitters in eastern U.S.A. have been measured in the conjugate region, at Faraday Station. Two identical narrow-band receivers, of the type described by N.R. Thomson (1981), were used. Ducted whistler mode signals from both transmitters were observed every night during Feb.-Mar. 1986, usually with multi-duct structure evident. Such structure was generally similar for the two transmitters, indicating propagation along a common set of ducts. This permitted the determination of the L values of the ducts without reference to natural whistler data. Typical one hop group travel times were in the range 300-900 ms and Doppler shifts in the range -500 mHz to +500 mHz. Most ducts could be tracked for several hours, and during the night their associated group travel times often exhibited a steady decrease followed by a steady increase. This drift reversal occurred at about 02 LT and was accompanied by a rapid change from positive to negative Doppler shifts. (Auth. mod.)

Rycroft, M.J., **Electrodynamics and magnetohydrodynamics of geospace,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.196-215, 30 refs.

The rationale for undertaking research on geospace is first reviewed. Overlooking time-dependent aspects of the problem, attention is concentrated on the steady state, magnetohydrodynamic interaction of the solar wind with the magnetosphere, and on the macroscopic treatment of ionospheric convection over the polar cap. The law of the conservation of magnetic flux out of the southern polar cap into the interplanetary medium is applied, as it is for the flux into the northern polar cap from interplanetary space above the ecliptic plane. Some recent radar results are mentioned, and some suggestions made for further experimental research, both in space and from the ground in the polar regions. (Auth.)

Gledhill, J.A., **Particle precipitation patterns in southern hemisphere high latitudes, longitude dependence,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.216-228, 25 refs.

Measurements of precipitating electron and proton fluxes in the Antarctic are reviewed. It is evident that the South Atlantic Anomaly and the large displacement of the south geomagnetic pole from the geographic pole are the dominating factors determining the distribution of particle precipitation in longitude. Most observations of energy spectra and pitch angle distributions have been averaged over longitude and are usually given in terms of magnetic coordinates thus losing interesting data from the geographical point of view. It is suggested that it would be worth the effort to re-analyze existing data to look for spectral and pitch angle dependence on longitude in the south polar regions. A short summary of the asymmetry between the north and south polar caps is also given. (Auth.)

Berkey, F.T., Sojka, J.J., Jarvis, M.J., **First results from a comparison of ground-based ionospheric measurements in the Southern Hemisphere and the USU global ionospheric model,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.278-286, 14 refs.

Two *F*-layer parameters have been derived from measurements made for quiet days during the austral summer and winter of 1982 at Siple and Halley stations. Even under quiet conditions, systematic differences in both parameters can be observed at the 2 sites. Insight into the source of these differences can be obtained from a comparison of the ionospheric data with theoretical data derived from the USU global ionospheric model. Under austral winter conditions, a relatively good model-observational comparison is obtained. However, for austral summer conditions this agreement is poorer, apparently due to the simplicity of the neutral wind incorporated into the ionospheric model. (Auth. mod.)

Krishnaswamy, S., **Statistics of auroral radio absorption at Siple and South Pole,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.287-297, 7 refs.

Analysis of cosmic noise absorption data from South Pole and Siple, (a pair of stations on opposite sides of the latitude of maximum auroral activity) has revealed important differences in the statistics of auroral radio absorption at the two locations. At Siple, there is a general tendency for summer absorption levels to be higher than the absorption in winter (especially around local magnetic noon), but the data (1975, 1980, 1982) show significant year-to-year variations in the diurnal patterns of absorption. The diurnal patterns at South Pole also exhibit year-to-year variations (1982-1985) but they are very different from those at Siple, and the winter/summer relationship also changes from year to year. A second difference has to do with the occurrence statistics: while at Siple the occurrence-frequency distribution departs significantly from a log-normal relation, the South Pole distributions are closer to a log-normal and the two sets of distributions can have substantially different trends above about 1 dB. Comparison with seasonal and annual means of the geomagnetic *Ap* index suggests that auroral absorption at Siple is more strongly correlated with *Ap* than is absorption at South Pole. (Auth. mod.)

Mendes da Costa, A., Rizzo Piazza, L., **PCA effects on a VLF transantarctic propagation path,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.298-312, 27 refs.

A study is presented of polar cap absorption (PCA) events from Sep. 1967 to Nov. 1974 and their effects on phase records of very low frequency (VLF) signals on NWC (Australia-Brazil) propagation path, crossing Antarctica. Nearly 50 PCAs of different intensities were studied and analyzed in detail. A good correlation between nighttime VLF signal phase advances and total proton flux content of energy 10 MeV $<$ E $<$ 30 MeV measured by satellites was obtained for strong PCA events. Geomagnetic storms with sudden commencement, associated or not with proton precipitation, also produce well defined VLF signal phase advances. Comparison of these results with those obtained in the Northern Hemisphere during PCA events may provide relevant information on the behavior of the ionospheric *D*-layer over the antarctic region. (Auth. mod.)

Bering, E.A., III, **1985-1986 South Pole balloon campaign,** *Tokyo. National Institute of Polar Research. Memoirs,* Aug. 1987 Special issue No.48, p.313-317, 7 refs.

This paper provides an overview of the University of Houston—University Park/University of Maryland—College Park balloon program that was carried out at Amundsen-Scott Station, during the 1985-1986 austral summer. The paper emphasizes objectives, instrumentation and operations. The quality of the data and periods of special interest are discussed. The primary experimental tools used in this program were unmanned stratospheric balloon payloads. In the month starting on Dec. 16, 1985 and ending Jan. 16, 1986, 8 successful balloon flights were conducted, ranging in duration from 6 to 103 h 30 min. A total of 468 h 30 min of data were obtained under a wide range of magnetic conditions. (Auth. mod.)

Carpenter, D.L., **Whistler studies of the plasmasphere shape and dynamics,** *Advances in space research,* 1986 6(3), p.5-19, 55 refs.

DLC QB495.A38

Whistler studies of the plasmapause/plasmasphere are traced from their beginnings during the IGY through the early 1960's, when extensive data from Antarctica became available. Highlights of this period include discovery of the 'knee' in the equatorial electron density profile, initial comparisons with results from the Lunik probes, identification of magnetic storm effects, and discovery of the duskside bulge. In the mid-1960's, whistlers provided the first evidence of cross-L plasma drift patterns in the outer plasmasphere. From a present day perspective, the plasmasphere is seen as a region penetrated, by the unsteady component of high latitude electric fields. In the predawn sector, post substorm outward drifts may be an after effect of the shielding of the plasmasphere against the steadier components of the substorm electric fields. The available indirect whistler evidence of plasmasphere erosion during large disturbances suggests that erosion occurs primarily in the dusk-premidnight sector. (Auth.)

Hansen, H.J., Scourfield, M.W.J., Rash, J.P.S., **Correlated pulsations in auroral light intensity and narrow band VLF emissions,** *Advances in space research,* 1986 6(3), p.227-230, 8 refs.

DLC QB495.A38

Observations at Sanae Station of pulsating aurora with a low light level TV system have been combined with simultaneous records of narrow band VLF emissions. Both auroral light and VLF intensities display a significant peak around 1.3 Hz in the power spectrum. The peaks in the auroral light intensity variations lead those in the VLF by times between zero and 200 ms, as revealed by cross-spectral analysis. Furthermore the 4 kHz VLF component leads the 3.5 kHz component by zero to 100 ms. These results are explained in terms of cyclotron resonance between the auroral electrons and VLF in a region displaced 8000 km from the equatorial plane. (Auth.)

Kokubun, S., **Dayside auroras,** *Polar news,* Jan. 1987 No.44, p.2-9, In Japanese.

Auroral phenomena in the dayside region attract recent attention in the study of the magnetosphere, as direct information sources for

the solar wind-magnetosphere interaction. Satellite observations have revealed the interesting characteristics that the activity of dayside auroras are not always correlated with the auroral substorm initiated in the midnight region. In this article recent topics of auroral observations are reviewed with an emphasis on the features of auroral display in the dayside region observed both on the ground and with satellites.

Craven, M., Essex, E.A., **Diurnal, seasonal and storm-time variability of the total electron content of the ionosphere north of Macquarie Island,** *Australian National Antarctic Research Expeditions. ANARE research notes,* Dec. 1987 No.56, 40p., 20 refs.

Presented are measurements taken near solar minimum of the total electron content (TEC) of the ionosphere equatorward of Macquarie I. using the Faraday rotation techniques. The data indicate that the peak in daytime TEC maximizes around late autumn, progressively decreases through winter to spring, and gradually recovers with the onset of summer. The morning post-sunrise build up phase of TEC becomes progressively less uniform from winter through summer, whilst the post-sunset TEC decay phase is often disrupted, during all seasons, by the onset of geomagnetic disturbances and/or the passage of the ionospheric trough. Magnetic storm events are often accompanied by a large increase in TEC lasting several hours, with increased geomagnetic activity on successive evenings, and a general reduction of daytime TEC levels during the storm recovery phase over 2-3 days. The largest percentage increases in TEC generally occur around the time of the minimum value of the Dst-index. (Auth.)

Bremer, J., **Control of particle precipitation into the middle atmosphere by regular changes of the interplanetary magnetic field,** *Gerlands Beiträge zur Geophysik,* 1987 96(3/4), p.362-371, With German and Russian summaries. 11 refs.

Negative *Bz* components induced by the interplanetary magnetic field (IMF) in the solar-magnetospheric coordinate system should favor precipitation of high energetic particles into the middle atmosphere whereas positive *Bz* values should inhibit such precipitation. In high subauroral and auroral latitudes this expected dependence of particle precipitation on IMF structure can be confirmed. In mid-latitudes, however, the most important precipitation events, the so-called after effects after strong geomagnetic disturbances, are only partly controlled by IMF sector structure. In particular, during the second part of the after effect after the main phase, internal magnetospheric loss processes which seem to be independent of solar sector structure play a dominant role. Hamilton, R.A., Gough, H., **Studies of standing-wave geomagnetic pulsations in the magnetosphere,** *British Antarctic Survey. Bulletin,* Nov. 1987 No.77, p.131-143, 7 refs.

An analysis has been made of the power spectra of Pc3 and Pc4 geomagnetic pulsations recorded at Halley Bay, St Anthony, Newfoundland, and at South Georgia. Halley Bay and St Anthony are geomagnetically conjugate stations on the L=4.2 magnetic shell and South Georgia is situated on the same geomagnetic longitude as these two stations, but at a lower L-value of 1.8 The power spectra of the pulsations recorded at the conjugate stations show that at any one time there may be several standing hydromagnetic waves on a particular shell, and that the frequencies of the oscillations differ from the expected natural oscillation frequency of the field line. On many occasions similar maxima are also observed in the power spectra of the pulsations recorded at the lower-latitude station, South Georgia. It is suggested that, on most occasions, the characteristics of the pulsations observed on the ground are mainly due to the travelling fast-mode hydromagnetic waves in the magnetosphere rather than standing waves on individual field shells. (Auth.)

Arshinkov, I.S., **Magnetic field measurements in the ionosphere-magnetosphere region,** *Advances in space research,* 1986 6(9), p.111-114, 9 refs.

An analysis of the differences between the magnetic field intensities, as measured by the Intercosmos Bulgaria 1300 satellite and computed from the IGRF-1980 values, is presented. On a global scale the residuals are negative. A 75 nT spacecraft remanent magnetic field along the X-axis is determined. It is found difficult to explain the negative residuals in the polar region by a magnetization along any of the axes. The complex character of the differences in this region is conditioned by the external fields, in particular, by the ionospheric current systems. It is suggested that the bias fields from the spacecraft have a static character and are found mainly along the X-axis. (Auth. mod.)

Lin, N.G., Cahill, L.J., Jr., Engebretson, M.J., Sugiura, M., Arnoldy, R.L., **Dayside pulsation events near the plasmapause,** *Planetary and space science,* Feb. 1986 34(2), p.155-181, Refs. p.179-180.

DLC QC801.P5

Four dayside pulsation events were observed from DE-1 near the equatorial plasmapause region on Aug. 23 and 24, Sep. 30 and Oct. 10, 1982. The corresponding ground data from Siple for three of them are presented and compared to the DE-1 data. The concept of field line resonance is applied to interpret the standing wave structure of the events. Most of the events exhibit complicated wave forms with transverse and compressional components seen simultaneously on the same field shell. For the long period waves a possible energy source is the Kelvin-Helmholtz instability at the magnetopause, while the radially polarized Pc 4 seen on Oct. 10 was attributed to bounce resonance excitation. "Wave bursts" (short intervals of 5-10 or more-cycles) were seen in almost all frequency ranges. The brief duration may be due to temporal or spatial variation of wave sources. A clear tendency of continuously decreasing wave period with decreasing L value was seen in many cases. This is attributed to the broad band frequency of the wave source which excites individual magnetic shells oscillating at their own eigenfrequencies. (Auth. mod.)

Belon, A.E., **Conjugacy of visual auroras during magnetically quiet periods,** *Journal of geophysical research,* Jan. 1, 1969 74(1), p.1-28, Refs. p.27-28.

DLC QC811.J6

The spatial and temporal conjugacy of auroras at high latitudes has been investigated by flights centered about magnetic midnight on Mar. 12, 14, and 16, 1967. A visual examination of all the data and a quantitative analysis of selected film frames indicate that, within the limits of error in the measurements and aircraft navigation, all the observed auroras were conjugate according to the CSFC 12/66 model of the *main* geomagnetic field. In most cases when the relative positions of aircraft and aurora were the same in both hemispheres, the conjugate auroras exhibited remarkably detailed similarity (point conjugacy) in their shape, intensity, and in their spatial and temporal variations. There is a tendency for the southern auroras to be located slightly eastward of the northern conjugate auroras. Preliminary results from similar conjugate flights conducted during Mar. 1968, a magnetically disturbed period, are briefly described. A visual inspection of these data has revealed substantial deviations in auroral conjugacy and a considerably more complex behavior of particle precipitation than that occurring during magnetically quiet periods. (Auth. mod.)

Tonegawa, Y., **Spectral characteristics of Pc 3 and Pc 4/5 magnetic pulsation bands observed near L=6,** *Journal of geophysical research,* Nov. 1, 1984 89(A11), p.9720-9730, Refs. p.9729-9730.

DLC QC811.J6

From dynamic spectral analysis of magnetic pulsations observed at Showa and Mizuho it is found that there are two predominant spectral bands throughout the daytime, one in the Pc 3 range with frequencies of about 20-80 mHz and the other in the Pc 4/5 range with frequencies of about 3-10 mHz. At synchronous orbit, corresponding spectral bands were seen in the azimuthal component with a harmonic structure when the satellite was located at the off-magnetic equator. The result suggests that the 3- to 10-mHz band is the fundamental mode of standing shear Alfvén waves and the 20- to 80-mHz band is the higher harmonics. However, both bands were not always enhanced simultaneously. Switching of activity between both bands was frequently observed on magnetically quiet days. This result indicates that the Pc 3 and Pc 4/5 bands are excited by different external driving sources. (Auth. mod.)

Matthews, J.P., **Observations of the VLF quiet band phenomenon,** *Journal of geophysics,* 1986 60(1), p.63-67, 18 refs.

In 1979, VLF receivers were operated near Roberval, Canada, by a team from the Japanese Institute of Space and Astronautical Science. Data obtained from this experiment on July 23 near 12.16 UT show one-hop signals at just below 3 kHz, originating from the VLF transmitter located at Siple Station. On the low-frequency side of the Siple signals, a 'quiet band' of background noise suppression is visible, approximately 95 Hz in width. The time taken for the effect to develop is between 5 and 10 s and the recovery time of the noise is 20 s or more. The level of suppression is 3 dB. The important aspect of these data is that, although growth is enhanced above the frequency of the Siple signals, on the lower border of the quiet band little or no enhancement is observed, in contrast to some theoretical models. (Auth.)

Arnoldy, R.L., Kaufmann, R.L., Cahill, L.J., Jr., Mende, S.B., **Pc 1 pearl-electron interactions on the L=4.2 magnetic shell,** *Geophysical research letters,* Aug. 1983 10(8), p.627-630, 11 refs.

A number of examples of auroral light bursts correlated with Pc 1 "pearl" wave packets have been recorded at Siple Station. The events are unique in that an individual light burst occurs at Siple not when the wave packet is recorded at Siple but rather when the wave is measured to be at the conjugate point over Roberval, Quebec. Although one can fit the observations to a model where ions are precipitated from an interaction region near the equator via cyclotron resonance, the number of ions required to produce the light and the above mentioned light burst-ULF wave phase relationship both make the precipitation of electrons a more plausible interpretation. The processes involved in this interpretation are set forth and discussed. (Auth. mod.)

Bell, T.F., Inan, U.S., Helliwell, R.A., **Nonducted coherent VLF waves and associated triggered emissions observed on the ISEE-1 satellite,** *Journal of geophysical research,* June 1, 1981 86(A6), p.4649-4670, 31 refs.

During the period Oct. 1977-Aug. 1979, the Stanford VLF receiver on ISEE-1 acquired data on approximately 90 separate orbits in the plasmasphere in which the satellite longitude lay within 30 deg of the magnetic field lines linking the North Dakota Omega transmitter. During 12 passes the nonducted Omega signals at 10.2 kHz were observed to trigger VLF emissions on magnetic shells ranging from L=1.8-3.8. The emission characteristics often differed significantly from those of emissions triggered by ducted signals and detected at ground stations. In many cases each of the triggered signals consisted of a large array of discrete rising tones whose rate of change of frequency approached 40 kHz/sec. Unusual emission activity involving signals from the Siple Station transmitter was also observed on two occasions outside the plasmasphere. The results indicate that the emission generation process can take place under much more general conditions than previously believed. (Auth. mod.)

Kuwashima, M., **Spectral characteristics of magnetic Pi 2 pulsations in the auroral region and lower latitudes,** *Journal of geophysical research,* June 1, 1981 86(A6), p.4686-4696, 76 refs.

The spectral characteristics of magnetic Pi 2 pulsations are studied in detail using data obtained simultaneously over a wide latitudinal range from the auroral region (L=7.5) through low latitudes (L=1.8). Pi 2 is revealed to be observed almost simultaneously with the onset of a substorm expansion over the wide latitudinal range with the common predominant period. The Pi 2 amplitude shows a primary maximum at the auroral oval and an additional secondary maximum near the plasmapause. The Pi 2 period generally becomes shorter (longer) when the associated auroral breakup starts at lower (higher) latitudes. Pi 2 is also observed simultaneously at a pair of conjugate stations in the auroral region with similar waveforms. These observational results support the torsional oscillation model which suggests that Pi 2 is caused by the hydromagnetic torsional oscillation of the geomagnetic field line anchored on the auroral oval. Arnoldy, R.L., Lewis, P.B., Jr., Cahill, L.J., Jr., **Polarization of Pc 1 and IPDP pulsations correlated with particle precipitation,** *Journal of geophysical research,* Dec. 1, 1979 84(A12), p.7091-7098, 27 refs.

The correlation of Pc 1 and IPDP pulsations with particle precipitation shows that the waves are left (L) polarized when observed simultaneously with precipitation. This is consistent with theoretical understanding of the generation of the pulsations as an L wave in the magnetosphere and the L wave propagation through the ionosphere with horizontal ducting of the R wave. It is suggested that L polarization of Pc 1 and IPDP locates the ULF source field line. Three events studied were IPDP correlated with riometer absorption. The observations strongly support the inward convecting source model for the generation of IPDP. On the other hand, the origin of the particles (presumably electrons) responsible for the riometer absorption is still an open question. Finally, a very long duration Pc 1 (HM emission) event is presented where L polarized wave packets were very closely correlated with auroral light bursts measured at 4278 Å wavelength.

Fukunishi, H., **Latitude dependence of power spectra of magnetic pulsations near L=4 excited by scc's and si's,** *Journal of geophysical research,* Dec. 1, 1979 84(A12), p.7191-7200, 25 refs.

Observational evidence from a latitude array of three ground-based magnetometer stations extending from L=3.2 to L=4.4 indicates that the damped-type oscillations excited by storm sudden commencements and sudden impulses contain many spectral peaks. Each spectral peak appears to have a different localization in latitude. The localization in latitude is quite different for the latitudinal and azimuthal *(H and D)* components. The conjugate magnetic data show that the *H* components oscillate in phase, while the *D* components oscillate out of phase at the conjugate pair stations. These observational facts are discussed using a theoretical result concerning

the response of the magnetosphere to an impulsive driving force. (Auth.)

Andrews, M.K., Lanzerotti, L.J., Maclennan, C.G., **Rotation of hydromagnetic waves between the magnetosphere and the ground,** *Journal of geophysical research,* Dec. 1, 1979 84(A12), p.7267-7270, 26 refs.

It is shown, via an analysis of ground-based magnetic field data and fixed-frequency VLF signals propagating in the whistler mode in the magnetosphere, that magnetospheric hydromagnetic waves (having periods of 60-120 s) observed on the ground have their wave ellipse orientations rotated by *pi*/2 from their orientations in the magnetosphere. This analysis provides a detailed nonstatistical confirmation of recent theoretical predictions of the rotation effect of the ionosphere/atmosphere/ground on hydromagnetic waves. (Auth.)

Duggal, S.P., Pomerantz, M.A., **Cosmic ray intensity pulses,** *Journal of geophysical research,* Dec. 1, 1979 84(A12), p.7343-7347, 17 refs.

Pulse variations in the galactic cosmic ray intensity, extending over intervals of several hours, have often been observed during cosmic ray storms as well as during other periods. On some occasions, these pulses appear in the data recorded at polar stations during epochs characterized by enhanced diurnal anisotropy at low latitudes. The short-term intensity increase at polar stations cannot be ascribed solely to the azimuthal anisotropy, and it is demonstrated that the cosmic ray transport during a pulse displays both azimuthal and north-south anisotropies. Furthermore, it is found that the magnitude of the pulse height recorded by a station is proportional to the exponential function *e* sup cosine of the angular separation between the mean asymptotic direction of viewing of the station and the direction of anisotropy in three-dimensional space. The relationship between pulse modulations and transient disturbances in the interplanetary magnetic field, and especially their location, remain to be investigated. (Auth.)

Duggal, S.P., Pomerantz, M.A., **Enhanced isotropic cosmic ray intensity waves during cosmic ray storms,** *Journal of geophysical research,* Dec. 1, 1979 84(A12), p.7382-7385, 32 refs.

A study of the abnormal cosmic ray storm that followed the solar particle ground level event (GLE) on Sep. 23, 1978, has revealed that the protracted recovery phase is impregnated with wavelike modulations that are associated with the rotational period of the sun. The analysis of data from the global network of stations has demonstrated that these large-amplitude waves are isotropic. From an analysis of axial and longitudinal anisotropies it is concluded that the observed fluctuations did not originate from periodic changes in the cosmic ray density gradient, either in or perpendicular to the plane of the ecliptic. Although these long-duration waves cannot be ascribed to singular features on the sun, it is speculated that they may reflect changes in the topology of active regions on the visible disk. In any case, it is clear that the scope of the classical picture, in which Forbush decreases are associated with short-term anisotropies, must be expanded to include long-duration wave phenomena. These new observations provide an important clue in understanding the physical mechanism that gives rise to long-duration cosmic ray storms. (Auth.)

Stoker, P.H., **Riometer absorption and spectral index for precipitating electrons with exponential spectra,** *Journal of geophysical research,* June 1, 1987 92(A6), p.5961-5968, 22 refs.

The altitude profiles computed in the mid 1970s for energy deposition in the atmosphere by electrons and electron-produced X rays are transformed to electron density profiles in order to calculate the absorption of cosmic radio noise at 20, 30 and 51.4 MHz. The electrons are precipitated isotropically over the downward hemisphere with exponential spectra having e-folding energies of 10, 50 and 200 keV. Relationships between parameters measured by the riometer or derived from those measurements are discussed. The absorption event recorded at Sanae, Antarctica, on June 27, 1982, at 0122 not only illustrates that the spectral index *n* is not a unique parameter when electron precipitation is not uniform in the field of view of a riometer antenna but suggests also highly wavelength selective scattering of cosmic radio noise from the more luminous parts of the radio sky. (Auth. mod.)

Candidi, M., Meng, C.-I., **Low-altitude observations of the conjugate polar cusps,** *Journal of geophysical research,* Feb. 1, 1988 93(A2), p.923-931, 31 refs.

A set of 118 pairs of nearly simultaneous polar cusp observations over opposite hemispheres, taken by two identically instrumented satellites on orbits that are very close to each other, is used to determine the morphology of the conjugate polar cusps. The general mirror image picture does not extend to the precision of a fraction of a degree in magnetic latitude (MLAT). Only 54% of the equatorial boundary observations and 32% of the poleward boundary observations are within p/m 1 deg of the conjugate location. The influences of the Earth's magnetic dipole tilt, of geomagnetic activity, and of the IMF parameters on the cusp asymmetry are investigated; no unique parameter is found to better organize the conjugacy of the two cusps. Rather, all of these parameters appear to have a slight effect on the relative locations of the opposite polar cusps. The difference in the MLATs between boundaries of conjugate polar cusp regions depends on the latitude of the cusp location. Furthermore, the projection of the boundaries of the polar cusp regions onto the ionosphere does not follow the offset circle that describes the configuration of the average auroral oval. (Auth.)

Campbell, W.H., Schiffmacher, E.R., **Quiet ionospheric currents of the Southern Hemisphere derived from geomagnetic records,** *Journal of geophysical research,* Feb. 1, 1988 93(A2), p.933-944, 13 refs.

This work describes the month-by-month behavior of the equivalent ionospheric current systems derived from spherical harmonic analyses of the quiet time geomagnetic field daily variations in 1965 at selected observatories representing the three southern global half-sector regions separately encompassing South America, Africa, and Australia. These external *Sq* current patterns were vortices having mid-latitude foci with midday summertime amplitudes reaching 16,-200 A above the midnight level. The wintertime amplitudes were about 10,000 A smaller. At low latitudes there was a large intrusion of the opposite hemisphere external *Sq* current system into the wintertime hemisphere at prenoon hours, displacing the primary current vortex to later postnoon hours. The behavior of the Southern Hemisphere external currents was found to be seasonally similar to that of the Northern Hemisphere for the same year. The quiet year behavior was compared to the results for the 1958 active year. The winter-to-summertime increase in focus current was similar in amplitude for the 2 years. The active year summertime and equinoctial current focus amplitudes were about 2.3 times the amplitudes of corresponding months in the quiet year. Data from these antarctic and subantarctic stations were used in this study: Argentine Islands, Eights, Byrd, Vostok, Kerguelen, SANAE, Roi Baudouin, Macquarie, Dumont d'Urville, and Wilkes. (Auth.)

Arnoldy, R.L., Engebretson, M.J., Cahill, L.J., Jr., **Bursts of Pc 1-2 near the ionospheric footprint of the cusp and their relationship to flux transfer events,** *Journal of geophysical research,* Feb. 1, 1988 93(A2), p.1007-1016, 45 refs.

Ground-based induction antennas at high latitudes measure a magnetic signature which can be modeled as the ground signature of a moving, large vortex of ionospheric Hall current. This Hall current is believed to be generated by the field-aligned current in a helical flux tube that has been reconnected: a flux transfer event (FTE). These possible FTEs are seen predominantly by ground stations near the dayside cusp, although similar signatures can be found near the plasmapause and in the polar cap. A significant result obtained from the induction antennas is that for about 60% of the cusp FTEs there are coincident Pc 1-2 pulsations. Pc 1-2 pulsations measured near the plasmapause which occur simultaneously with the cusp Pc 1-2 coincident with FTEs pose some questions about the generation of the Pc 1-2 and whether the FTE signatures may not simply be the result of solar wind pressure impulses on the magnetopause. Data for this study is from records made at Sondre Stromfjord, Greenland and Amundsen-Scott Station at the South Pole. Comparisons are made from observations taken at both stations. (Auth. mod.)

Cazeneuve, H., Grinspon, Y.M., **Spectral analyses of ionospheric and magnetic disturbances** [Analisis espectral de perturbaciones ionosfericas y magneticas], *Buenos Aires. Instituto Antártico Argentino. Contribución,* 1987 No.357, 25p., In Spanish with English, French and German summaries. 12 refs.

Geomagnetic and ionospheric activities during disturbed conditions have been analyzed by applying spectral analysis techniques to data from Belgrano II Station, in the auroral zone. In order to obtain a quantitative characterization of the spectral results, the spectra were parameterized. The spectral power and slopes are found to exhibit recurrent variations, which indicate a continually varying power redistribution. The effects of the variations are felt at the station as it faces successive disturbance sectors during its daily rotation. (Auth. mod.)

Ogawa, T., Igarashi, K., Aikyo, K., Maeno, H., **NNSS satellite observations of medium-scale traveling ionospheric disturbances at southern high-latitudes,** *Journal of geomagnetism and geoelectricity,* 1987 39(12), p.709-721, 17 refs.

From Mar. 1985 to Jan. 1986, 428 medium-scale traveling ionospheric disturbances (TID's) incident to the high-latitudes between 50 and 85S were detected at Showa Station by means of differential-Doppler measurements of the 150 and 400 MHz beacon waves from 6 NNSS satellites. Statistical analysis indicates that (1) the medium-scale TID's at high-latitudes appear quite often during geomagnetically quiet and moderately disturbed conditions, and their occurrence seems not to increase with increasing geomagnetic activity; (2) they attain the maximum activity in winter and the minimum in summer; (3) diurnal variation shows the maximum occurrence around 1400-1600 LT with a second maximum around midnight, and (4) most of the medium-scale TID's propagate from south toward the equator. These findings are compared with TID observations using NNSS made at mid-latitudes (30-55N) to find a fairly good consistency between both results. (Auth.)

Poulsen, W.L., Inan, U.S., **Satellite observations of a new type of discrete VLF emission at L<4,** *Journal of geophysical research,* Mar. 1, 1988 93(A3), p.1817-1838, 22 refs.

Emission elements of a new type of whistler mode emission are confined to a bandwidth of 1-5 kHz, with the lower cutoff frequency of the band varying with *L* shell, being equal to about 0.2-0.5 times the equatorial electron gyrofrequency. The discrete and burstlike nature of the emissions is similar to that of chorus emissions typically observed at higher *L;* however, dispersion of individual elements is often different from typical chorus, and the emissions are observed inside as well as outside the plasmapause. The analysis of data from the low-altitude ISIS 2 and the high-altitude DE 1 satellites indicates that the emissions may be generated near the equatorial plane. Observations in the vicinity of low-altitude crossings of the plasmapause also indicate the presence of a second emission band which is interpreted to result from the reflection of the equatorially generated emissions from the lower ionosphere. Data acquisition was done at Siple Station during 1982-1983 in support of VLF wave injection experiments. (Auth. mod.)

Persoon, A.M., **Electron density depletions in the nightside auroral zone,** *Journal of geophysical research,* Mar. 1, 1988 93(A3), p.1871-1895, 71 refs.

Measurements from instruments on board Dynamics Explorer 1 are used to study regions of diminished electron density in the nightside auroral zone. Local electron densities are obtained from the electron plasma frequency cutoff of the whistler mode auroral hiss. Electron density profiles are highly variable through the nightside auroral zone. Sharply defined regions of low electron densities are a common feature of auroral zone crossings from the predusk hours until the early morning hours at all radial distances. Electron densities in these regions are strongly depleted in relation to the adjacent polar cap and plasmaspheric densities, forming a low-density cavity at 70 deg invariant latitude. A comparison of the electron density depletions with simultaneously measured low- and high-energy particle measurements indicates a correspondence between low auroral plasma densities and upward directed ion beams and conics. Low-energy upflowing H cations are strongly correlated with the poleward edge of the auroral cavity. Peak energies of the precipitating electron population occur inside the cavity interval. These correlations show that density depletions in the nightside auroral zone are directly associated with auroral acceleration processes. Data from the Southern Hemisphere to latitude 80S were used in this study. (Auth. mod.)

Sá, L.A.D., Helliwell, R.A., **Structure of VLF whistler mode sideband waves in the magnetosphere,** *Journal of geophysical research,* Mar. 1, 1988 93(A3), p.1987-1992, 7 refs.

An accurate determination is made of the sideband structure of ducted VLF whistler mode waves transmitted from Siple Station and observed at Lake Mistissini, Quebec. Single- and double-frequency experiments are described. It is shown that sideband spectra can be

explained by nonlinear interactions between two or more lines in the magnetosphere, the line intensities required for such interactions being low. If one of the lines is a transmitted carrier, the other line can be as much as 40 dB lower in amplitude, implying that power line radiation (PLR) can be an important factor in sideband generation. It is shown that "single-line" sidebands are due to interactions between the input wave and harmonics of 60 Hz present within the duct (assumed to be PLR), and that double-line spectra are affected by their position relative to the same 60-Hz system of lines. A study of double-line spectra as a function of line separation and line amplitude ratio is made. (Auth.)

Sandholt, P.E., **Interplanetary and geophysical effects of a coronal transient,** *Annales geophysicae,* Aug. 1987 5(4), p.219-230, Refs. p.228-229.

This report presents a study of the flare-related coronal transient on Nov. 27, 1979, with the resulting interplanetary (IP) shock and the associated auroral and magnetic effects that were observed from the ground 72 h after the initial coronal brightening. The observed disturbance of the interplanetary magnetic field resulting from the coronal mass ejection is discussed in relation to a model description of flare-related perturbations of the solar current sheet. The power transfer from the solar wind to the magnetosphere did not rise above the threshold value for magnetospheric storm triggering in this case. Thus, the IP shock was not followed by a major storm. However, distinct signatures related to the IP disturbance were observed in the polar cusp aurora above Svalbard, in the local magnetic field and at the conjugate location in Antarctica. The relevance of the present observations for different models of plasma transfer from the magnetosheath is discussed. (Auth. mod.)

Shea, M.A., **Cosmic ray latitude surveys in the Atlantic Ocean area,** *U.S. Air Force Geophysical Laboratory. Technical report,* 1987 AFGL-TR-87-0292, 4p., ADA-187 102, 10 refs. Reprinted from 20th International Cosmic Ray Conference, Conference Papers, 4, 201-203.

Vertical cutoff rigidities have been re-determined for the locations of the stratospheric balloon measurements made during the 22nd Soviet Antarctic Expedition (1975-1976) between the Soviet Union and Antarctica, via Africa, South America and Europe. These cutoff rigidities were determined for the month of each measurement using a method that interpolates between the world grids of trajectory-derived vertical cutoff rigidities calculated for Epoch 1965.0 and Epoch 1980.0. In comparing these with other values calculated using the 1975.0 field models which under-estimated the secular variations, small increases in the vertical cutoff rigidities were noted in the North Atlantic area and small decreases were noted in the South Atlantic, consistent with the secular changes in the world grid of vertical cutoff rigidities. These results emphasize the necessity of determining cutoff rigidity values of the year in which latitude measurements are made if these measurements are in the region of the world (particularly the Atlantic Ocean area) where the cutoff rigidity values are rapidly changing. Rees, D., **Thermospheric dynamics: understanding the unusual disturbances by means of simulations with a fully-coupled global thermosphere/high-latitude ionosphere model,** *Annales geophysicae,* Dec. 1987 5(6), p.303-328, Refs. p.327-328.

Strong geomagnetic disturbances have generated complex thermospheric disturbances and wind patterns which have been difficult to interpret using global thermospheric models. As a step towards an improved understanding of the complex disturbances, a fully self-consistent numerical model of the polar ionosphere and the global thermosphere has been developed. This model is capable of predicting the dynamical and chemical interactions between the neutral and ionospheric constituents of the polar regions in the presence of combined solar and geomagnetic forcing. In this paper, the effects of self-consistent enhancements of *E*- and *F*-region ionization and conductivity within the auroral ovals and polar regions, and the consequent response of the neutral circulation to geomagnetic forcing are discussed. The plasma densities of the auroral *E*-region are significantly enhanced even under quiet geomagnetic conditions, leading to a more consistent description of the interactions. Rather unusual and large thermospheric wind and structural disturbance patterns are observed during highly disturbed geomagnetic conditions. Future objectives for quantitative understanding and modelling of the disturbed thermosphere should be the simultaneous mapping of precipitation and convection patterns over the polar regions. (Auth. mod.)

Thayer, J.P., **Thermospheric neutral wind signatures dependent on the east-west component of the interplanetary magnetic field for Northern and Southern Hemispheres as measured from Dynamics Explorer-2,** *Annales geophysicae,* Dec. 1987 5(6), p.363-368, 24 refs.

Vector neutral wind measurements derived from observations made on the low-altitude, polar-orbiting, Dynamics Explorer-2 (DE-2) spacecraft have been collated and analyzed to investigate the influence of the sign of the interplanetary magnetic field (IMF) east-west component *(By)* on the mean high-latitude thermospheric neutral circulation at *F*-region altitudes for the northern (winter) and southern (summer) polar regions. The results of the study include the following: in the Southern Hemisphere for negative *By* a large anticyclonic circulation cell (associated with the dusk ion-convection cell) is present in the mean wind pattern, with the region of most rapid anti-sunward flow located on the dawn-side of the geomagnetic polar cap. For positive *By* the anticyclonic circulation cell is smaller and is largely confined to the evening sector. In the morning sector for both signs of *By* the mean neutral wind pattern is influenced by ion-drag forces associated with the cyclonic (dawn) ion-convection cell, but does not exhibit a region of sunward-directed mean flow. In the southern polar region the direction of the anti-sunward polar-cap wind rotates from about 7 deg offset from the noon-midnight meridian towards dusk for *By* positive to about 15 deg offset towards dawn for *By* negative. Anticyclonic vorticity in the neutral circulation, associated with the dusk cell of ionospheric convection, is substantially greater than cyclonic vorticity associated with the dawn cell of ionospheric convection for both hemispheres, irrespective of the sign of *By*. Winds associated with the anticyclonic neutral vortex are more rapid and the vortex occupies a greater spatial area in the Northern Hemisphere when *By* is positive and in the Southern Hemisphere when *By* is negative. Roble, R.G., Ridley, E.C., **Auroral model for the NCAR thermospheric general circulation model (TGCM),** *Annales geophysicae,* Dec. 1987 5(6), p.369-382, Refs. p.381-382.

A model of high latitude auroral processes has been developed for use in the National Center for Atmospheric Research (NCAR) thermospheric general circulation model (TGCM). The ion drift pattern associated with magnetospheric convection is specified by the empirical model of Heelis et al. (1982) considering offset geographic and geomagnetic poles. An analytic prescription of particle precipitation in the auroral oval is developed that enables rapid numerical evaluation of auroral ionization rates and global aurora power input. The auroral zone half-width, mean particle energy, and particle flux can all vary with magnetic local time and the latitudinal variation of particle flux is Gaussian. Illustrations of contours of electric potential (kV) and E x B ion drift vector pattern of magnetospheric convection, and

contours of calculated neutral temperature and neutral wind vectors over the Southern and Northern hemispheres, are shown and discussed. (Auth. mod.)

Rycroft, M.J., **Some aspects of geomagnetically conjugate phenomena,** *Annales geophysicae,* Dec. 1987 5(6), p.463-478, Refs. p.476-477.

Both charged particles and waves convey information about the thermosphere, ionosphere and magnetosphere from the Northern to the Southern Hemisphere and *vice versa,* along geomagnetic flux tubes. The interhemispheric travel time of electrons or ions, being dependent upon *L*-value, pitch angle and energy, may be many hours, ranging down to 1 s. Such times give the time scales of transient phenomena that are geomagnetically conjugate and of changes in steady-state plasma processes occurring in geomagnetically conjugate regions. Contrasting examples are presented of conjugate physical phenomena, obtained using satellite, rocket, aircraft and ground-based observations; the latter capitalize upon the rather rare disposition of land—rather than ocean—at each end of a geophysically interesting flux tube. Particular attention is paid to the interactions between whistler mode waves and energetic electrons. (Auth. mod.)

Lanzerotti, L.J., **Studies of a cusp-region hydromagnetic wave event with magnetometers and incoherent scatter radar,** *Annales geophysicae,* Dec. 1987 5(6), p.479-484, Refs. p.483-484.

A large-amplitude (about 100 nT) low frequency (about 0.002 Hz) hydromagnetic wave event was measured with magnetometers at three sites in conjugate areas near the magnetospheric cusp regions and with an incoherent scatter radar (ISR) at one site (Sondre Stromfjord). The magnetic signatures of the event showed good conjugacy between South Pole and Frobisher Bay (near-conjugate stations). A linear polarization was observed at the stations at the time of occurrence of the maximum amplitude of the event. The measured magnetic field variation amplitudes in the north-south direction were well-predicted by calculations based upon the ISR determinations of the ionospheric electric fields; the observed magnetic variations in the east-west direction were not well predicted. The ISR results give a good measure of the ionospheric ion heating produced by such a large-amplitude hydromagnetic wave event. (Auth.)

Bering, E.A., III, Benbrook, J.R., **Conjugate ionospheric electric field measurements,** *Annales geophysicae,* Dec. 1987 5(6), p.485-502, Refs. p.502.

Eight campaigns that attempted conjugate electric field measurements are discussed: from Kauai, Hawaii in 1971 and 1972, on the Siple Station-Roberval field line in 1969-1970, 1975, 1978 and 1980-1981, a two-latitude campaign involving Siple-Roberval and Byrd-Great Whale River in 1971, and at South Pole in 1985-1986. In these campaigns there were twelve experiments that made reasonably conjugate observations. These data indicate that electric fields at conjugate locations were not well correlated about half of the time. Interpretations of these events suggest that there was one case where the observations were on open field lines, two cases where uncorrelated atmospheric dynamo fields seemed to be present, two cases where magnetospheric Birkeland currents were probably present, and three cases where the interpretation is uncertain. (Auth. mod.)

Gledhill, J.A., **Twenty-five years of antarctic upper atmospheric research at Rhodes University,** *South African journal of science,* Mar. 1987 83(3), p.147-152, 20 refs.

Highlights of the South African experience in upper atmospheric physics are reviewed. Five years after the IGY, the first ionosonde was set up at SANAE and by 1963 the ionization measurement program was well established. In the 1960s new instrumentation replaced older equipment and oblique incidence ionograms were incorporated into the program. Particle precipitation observations were also emphasized and the SANAE bulletins of ionospheric characteristics provided wide circulation of the observed data. In the 1970s and early 1980s airglow observations enhanced the program and in 1983 the ISAAC (International South Atlantic Anomaly Campaign) program achieved notable success in measuring various kinds of E region ionization.

Gulinskiĭ, O.V., Libin, I.IA., Prilutskiĭ, R.E., **Fluctuations of cosmic rays during periods of disturbances,** *Geomagnetism and aeronomy,* 1986 (Pub. Feb. 1987) 26(4), p.445-449, Translated from Geomagnetizm i aeronomiia. 12 refs.

Problems in the determination of the characteristics of random and regular magnetic fields according to fluctuations of cosmic-ray intensity (CRI) are examined. The processing of ground data on CRI is considered in connection with the essential nonstationary character of the random processes recorded, and methods for the identification and separation of spectral peaks are discussed. Utrecht and Kerguelen data for Sep. 7-24, 1977, are used to test the proposed algorithms. (Auth. mod.)

Imhof, W.L., Voss, H.D., Datlowe, D.W., Mobila, J., **Isolated electron precipitation regions at high latitudes,** *Journal of geophysical research,* Apr. 1, 1988 93(A4), p.2649-2660, 17 refs.

An investigation has been made at high latitudes of regions or patches of isolated electron precipitation with data acquired by payload systems on the S81-1 satellite. Newer studies show that when some patch regions are processed with greater sensitivity, nearby weaker patches are found. This characteristic suggests that some of them may be parts of larger structures. There is considerable overlap in spectral shape between patches and larger structures, but the energy spectra of the X rays emitted from the patches are softer even at similar invariant latitudes. The majority of patches are not associated with auroral substorms and therefore appear not be related to westward traveling surges. At least some of the small precipitation patches reported here seem to be parts of larger structures which may encompass a variety of forms, including those that are arc-shaped in nature. (Auth. mod.)

Jakobs, H.J., Hass, H., **Normal modes as simulated in a three-dimensional circulation model of the middle atmosphere including regional gravity wave activity,** *Annales geophysicae,* June 1987 5(3), p.103-114, 35 refs.

Investigations of gravity wave effects are made in a 3-D circulation model atmosphere extending from 10 to 150 km altitude. The main effect of regional gravity wave sources is the *in situ* generation of large-scale perturbations in the mesopause region. A space-time spectral analysis together with a bandpass filtering method show that most of the longer period disturbances approximately exhibit normal mode characteristics. The long period spectral range identifies westward traveling waves with periods of 30 h, 40 h, 2 d, 4 d and 8 d and an eastward traveling equatorial Kelvin wave with a period of nearly 3 d. The horizontal and vertical structure of the former simulated disturbances in the model are in close agreement with observations and theory of atmospheric normal modes, while the latter corresponds to the equatorial mesospheric Kelvin wave. (Auth.)

Thuillier, G., Christophe, J., Dousset, C., Fehrenbach, M., **Auroral occurrence from 1963 to 1970 as observed at Dumont d'Urville Station,** *Annales geophysicae,* June 1986 4(3), p.247-257, Refs. p.256-257.

An all sky camera is used at Dumont d'Urville Station since 1957. A new data processing, based on the determination of the aurora intensity has been performed. The auroral occurrence is studied in three zones: North, Zenith and South of the station. Several properties of the auroral occurrence are derived: diurnal variation depending upon the season; relation with magnetic activity; occurrence of auroras of different brightnesses; long term and seasonal variations. All results show that the station exhibits mixed features of auroral zone and polar cap types depending upon UT and local magnetic activity. Auroral iso-occurrence lines are derived as a function of magnetic activity and season. The equinox auroral oval appears equatorwards shifted with respect to the winter one. Auroral occurrence and electron precipitation patterns are compared. Low energy electrons (some keV) seem the most responsible of the observed features. (Auth.)

Hurren, P.J., Smith, A.J., Carpenter, D.L., Inan, U.S., **Burst precipitation induced perturbations on multiple VLF propagation paths in Antarctica,** *Annales geophysicae,* Aug. 1986 4(4), p.311-318, 26 refs.

The burst precipitation of energetic ($E>40$ keV) electrons near $L=4$ has been detected as amplitude perturbations (Trimpi events) on subionospheric 3.79 kHz CW signals from the Siple ($L=4.2$) VLF transmitter that were observed at Halley ($L=4.3$), Palmer ($L=2.3$) and South Pole ($Lambda=74$ deg) stations. The observations were made on the dayside of the Earth but beneath a locally dark ionosphere, during a generally disturbed 6 d period in July 1982 when the plasmapause projection was equatorward of the Halley and Siple-South Pole paths. Events detected at Halley showed similarities to Trimpi events previously reported on paths beneath the plasmasphere, but were of larger amplitude (1-8 dB, compared to typically 0.5-2 dB at lower latitudes), were time correlated with a wide variety of VLF noise forms in addition to whistlers, and were more variable in form and duration (up to 10-20 s). A minority of the events were observed simultaneously on two paths, and these tended to be associated with whistlers. (Auth.)

Menvielle, M., Mareschal, M., **Anticorrelation between strengths of internal and transient external magnetic fields?,** *Annales geophysicae,* Aug. 1986 4(4), p.327-331, 12 refs.

A statistical study of auroral activity based on K indices recorded over 20 years (1959-1978) indicates the existence of some anticorrelation between local strength of the main field (given by the appropriate International Geomagnetic Reference Field) and amplitude of the external variation at the same site. The anticorrelation might also exist at low latitudes between internal and external fields not directly related to particle precipitation. (Auth.)

Carpenter, D.L., Bell, T.F., Smith, A.J., **Siple VLF transmitter as a multi-frequency probe of the Earth-ionosphere waveguide,** *Journal of atmospheric and terrestrial physics,* Feb. 1988 50(2), p.105-115, 29 refs.

1983 receptions of subionospheric signals radiated from Siple to neighboring stations Palmer, and South Pole, each about 1500 km from the horizontal (magnetically east-west) VLF transmitting antenna at Siple, were strongly dependent upon azimuth and upon signal frequency. At Palmer signals near 2.5 kHz were often well defined, while the third harmonic of the transmitted signal, near 7.5 kHz, was not detected. Meanwhile, at Halley, the third harmonic was regularly observed and directionally stable, while the fundamental was often weak or undetectable. The field strength of the third harmonic component at Halley exceeded by about 40 dB the level of the fundamental, when both were normalized to the same antenna input power. The observed effects represent a way of extending the effective frequency range of the narrowband Siple antenna system, and also, by using the new crossed dipole configuration at Siple, of selectively probing certain regions of the Earth-ionosphere waveguide. Takahashi, T., **Observation of electron density in the auroral ionosphere—results of the antarctic rockets S-310JA-11 and -12,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.9-15, 4 refs.

During the 26th JARE measurements of electron density were carried out as a part of the coordinated rocket experiments (S-310JA-11 and -12) for wave-particle interactions in the auroral ionosphere. The two rockets were launched into the auroral arcs of different type on May 29, 1985 and July 12, 1985, at Showa Station. The electron density profiles show characteristic signatures corresponding to the auroral forms and activities. Especially low altitude ionospheric layer of high electron density was observed in a bright arc of the break up type aurora by S-310JA-12 during its ascent. (Auth.)

Mori, H., **Comparative analysis of electron density and electric field fluctuations in highly active auroras observed by a sounding rocket S-310JA-12: preliminary results,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.16-24, 6 refs.

The S-310JA-12 rocket was launched geomagnetically northward from Showa Station during a strong substorm period. The onboard instruments were a Faraday cup for measuring electron density and its fluctuations up to 8 kHz together with total flux of electrons with energies above 105 eV, and a pair of double probes for measuring DC electric field and electric field fluctuations of 5-220 Hz, which detected various kinds of ELF-VLF band fluctuations during the flight. During the ascent, the Faraday cup observed strong VLF fluctuations in the *E* region and burst-like fluctuations over the region from 140 to 200 km in altitude. Around the height of 220 km, quasi-sinusoidal waves with the frequency of about 150 Hz were observed by both instruments. During the descent, the rocket passed through highly active auroras and both instruments observed strong ELF fluctuations. The Faraday cup measurement suggests that the rocket was considerably charged up by the precipitating electrons in the auroras. (Auth.)

Nagano, I., **Height variations of auroral hiss observed by S-310JA-11 and -12 rockets,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.25-36, 16 refs.

Electromagnetic waves constructing auroral hiss in the VLF range were observed by the S-310JA-11 and -12 rockets launched into a quiet auroral arc and into a breakup aurora respectively, from Showa Station. An altitude profile of the electric field intensity, which peaked at an altitude of 90 km, was observed by the S-310JA-12 rocket in the frequency range less than 5 kHz. An estimation of the source location of the auroral hiss was made with the altitude profile of the hiss intensity calculated by the full wave analysis so as to agree with those observed especially around the altitude of 90 km. It was found that the auroral hiss is most likely to be generated at an altitude about 700 km or less. On the other hand, the absolute intensity of the auroral hiss at a frequency of 4 kHz observed by the rocket was stronger by about 50 dB than that observed at Showa Station. This means that the *k*-vector direction of the auroral hiss actually observed by the rocket lay outside the transmission cone, so that the auroral hiss reached Showa Station at a very weak intensity. (Auth.)

Sagawa, E., **Rocket observations of modulations of the low energy electron flux in the auroral ionosphere,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.37-45, 11 refs.

An instrument has been developed for observing the high frequency modulations or fluctuations of the auroral electron flux. The instrument utilizes on-board processing hardware for calculating autocorrelation functions of particle flux measured by any type of particle detector which emits a series of pulses. Two rocket observations using the instrument were carried out as a part of low energy auroral electron experiments on board the S-310JA-11 and -12 rockets which were launched into the antarctic auroral ionosphere. The instrument is capable of measuring the flux modulations in 3 frequency ranges, i.e. 1.5-100 Hz, 0.1-8 kHz and 0.1-4 MHz, respectively. Results from one rocket experiment launched under relatively quiet conditions indicate that the auroral electrons are almost uniform in the high frequency range. Results from another rocket experiment (JA-12) conducted under highly active aurora conditions show low frequency modulations of electron flux associated with a strong electron precipitation. Suzuki, H., **Auroral X-ray images observed by B15-3 balloon over Syowa Station, Antarctica,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.46-55, 11 refs.

A balloon observation of auroral X-rays was carried out over Showa Station in Dec. 1985 using a set of 3 inclined NaI(T1) scintillation counters. The energy-dependent structures of X-rays with energies greater than 22 keV were measured. In a case study of the X-ray event which occurred at 0145 UT on Dec. 14, an X-ray source region moved toward lower latitudes with a velocity of about 1 km/s. This experimental result was confirmed by a simulation calculation for auroral X-ray sources. The spatial distributions of auroral X-rays were consistent with the north-south dependence of 30 MHz cosmic noise absorption observed by a scanning-beam riometer at Showa Station. (Auth.)

Kodama, M., **Auroral X-ray image formings using three directional NaI (T1) telescopes at balloon altitude,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.56-64, 10 refs.

This report presents the spatial distributions of auroral X-rays obtained by the balloon flight named AZCO-C1, which was launched from Norway in July 1985. A time sequence of auroral X-ray images was derived by using a set of 3 NaI (T1) scintillation counters for each of the 3 different energy channels: 22-35, 35-55 and 55-88 keV. The precipitation region of energetic particles and its modulations with time were well demonstrated, though the X-ray enhancements were only 3 times the background flux. The flight path of the balloon was such that it drifted over Iceland, a conjugate point of Showa. Unfortunately, when the balloon was over Iceland, clouds were over Showa so that the all-sky was not able to photograph the events. (Auth. mod.)

Maeda, S., Fuller-Rowell, T.J., Evans, D.S., **Thermospheric structure associated with discrete levels of auroral activity,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.99-109, 13 refs.

A time-dependent calculation has been done to study dynamical and compositional structure of the thermosphere associated with discrete levels of auroral activity. The auroral activity level is given in terms of estimates of hemispheric power input due to particle precipitations. Heat and momentum input originated from the magnetosphere is estimated by using an empirical model constructed from the two data bases of the precipitating particles monitored by the TIROS/NOAA satellites and the ionospheric convection electric field measured by the Millstone Hill Incoherent Scatter Radar. The main results are discussed. The latitudinal grid for the model extends between the two geographic poles in 5 degree increments. (Auth. mod.)

Sakurai, T., Tonegawa, Y., Sato, N., **Oscillation characteristics of Pi2 in auroral zone: Syowa-Iceland conjugate study,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.110-120, 11 refs.

Oscillation characteristics of Pi2 magnetic pulsations observed in auroral region have been statistically examined on the basis of the magnetic field data obtained at the conjugate stations, Showa Station and Husafell, Isafjördur and Tjörnes in Iceland. The examination reveals that the characteristics are quite different between the *H* and *D* components of Pi2 magnetic pulsations. The pulsations in *H* component show larger amplitude than in the *D* component. The orientation of the principal axis, ellipticity and phase relations of Pi2 oscillations are also statistically investigated. The important characteristics of Pi2 as hydromagnetic waves (HM waves) generated in the magnetosphere are believed to be exhibited well in the *H* component. All of the characteristics show that oscillations of Pi2 in auroral region are found to be resonant oscillations of magnetic field-line. Regarding the conjugacy of Pi2 oscillations, Showa and Husafell is also found to be the best conjugate station-pair in comparison with other station-pairs of Showa-Isafjördur, and Showa-Tjörnes. Ondoh, T., **Occurrence map of broad-band auroral VLF hiss observed by ISIS satellites,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.153-167, 20 refs.

A polar map of occurrence rate of broad-band auroral VLF hiss is drawn by using narrow-band VLF intensity data of 6 frequencies which were processed from ISIS electric field (50 Hz-30 kHz) tapes of 347 passes received at Showa Station from June 1976 to Jan. 1983. The high-latitude contour of occurrence rate of 0.3 lies at 74 deg around 10 h geomagnetic local time (MLT) and it extends down to 67 deg around 22 h MLT, showing a symmetricity with respect to the 10-22 h MLT meridian. Two regions of high occurrence rate above 0.5 lie between 76 and 78 deg in the afternoon sector and also between 78 and 81 deg in the late night-morning sector. The result is not consistent with the occurrence map of auroral hiss at 9.6 kHz with a pronounced dawn-dusk asymmetry obtained from Ariel magnetic field data by earlier investigators. This discrepancy between the ISIS and Ariel results is discussed from viewpoints of auroral particle precipitation and difference in VLF data used. (Auth.)

Aikyo, K., Ondoh, T., Ohtaka, K., **Some characteristics and propagation of whistler-mode LF/MF emissions as observed at low altitudes above the antarctic region with ISIS-1,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.173-184, 19 refs.

Whistler-mode (w-mode) emissions in LF/MF bands observed at low altitudes in the nighttime auroral zone are examined in detail, especially from the viewpoint of the spectral characteristics and directions of wave vectors of the emissions using the ISIS-1 data including the fixed and swept frequency ionograms and AGC voltage traces of the sounder receiver. The emissions are characterized by spectra with relatively sharp upper cutoff ranging 0.75 to 0.4 electron gyrofrequency and with lower frequency cutoff less than 0.1 MHz for many cases. The directions of wave vectors at the satellite are determined from the antenna orientation at the instant when the emissions exhibit intensity minima on AGC voltage traces in the fixed frequency mode. The resultant directions of wave vectors are used as initial conditions for ray tracing to locate the source regions and to know the directions of wave vectors at the source region. It is shown that the cyclotron maser instability driven by auroral electron with upward loss cone at low altitudes is the most probable source mechanism which explains some characteristics of the observed emissions, particularly of their high frequency portion. (Auth.)

Ogawa, T., Igarashi, K., Aikyo, K., Maeno, H., **Satellite observation of medium-scale traveling ionospheric disturbances over Syowa Station,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.192-198, 8 refs.

From Mar. 9, 1985 to Jan. 11, 1986, 428 medium-scale traveling ionospheric disturbances (TID's) were detected at Showa Station by means of differential-Doppler measurements with the 150 and 400 MHz beacon waves from 6 NNSS satellites. Statistical analysis shows that (1) the medium-scale TID's in the polar regions appear quite often during geomagnetically quiet and moderately disturbed conditions and their occurrence seems not to increase with increasing geomagnetic activity, (2) they attain the maximum activity in winter and the minimum in summer, (3) diurnal variation shows the maximum occurrence around 1400-1600 LT with a second maximum around midnight, and (4) most of the medium-scale TID's propagate from south toward the equator. These findings are compared with observations made at midlatitude to find a fairly good consistency between both results. It is pointed out that the gravity waves excited in the mesosphere rather than in the auroral ionosphere play an important role in producing most of the observed medium-scale TID's. (Auth.)

Igarashi, K., Ogawa, T., Maeno, H., Kuratani, Y., **Ionospheric disturbance effect on NNSS satellite positionings at Syowa Station,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.199-203, 4 refs.

An experiment for investigating a relation between geomagnetic disturbance and satellite positioning error in the polar region was carried out at Showa Station in 1985 and 1986 with a two-wave (150 and 400 MHz) NNSS receiver. From the analysis of positioning data of about 10,000 passes over 245 days, it is clearly found that the position determination error increases with increasing geomagnetic disturbance level (local K-index) and the number of passes on which the position determination is successful decreases by one or two per day when K-index is large. These results suggest that when the ionosphere is highly disturbed the 150 and 400 MHz radio waves from the satellites are strongly scattered by ionospheric irregularities and/or spatial gradients of the electron density associated with ionospheric disturbances. (Auth.)

Nozaki, K., Kikuchi, T., **Preliminary results of the multimode FM/CW ionosonde experiment,** NIPR Symposium on Upper Atmosphere Physics, Proceedings. No.1, Tokyo, National Institute of Polar Research, 1988, p.204-209, 8 refs.

Bottomside ionospheric observation was made with a microcomputer-controlled FM/CW ionosonde at Showa Station. This ionosonde provides ionograms for the transmitter frequencies from 2 to 16 MHz and also sequential data of virtual height (h') at a fixed frequency with a time resolution of 10 s. Since the peak power of the FM/CW ionosonde is 20 W, continuous observation was possible without disturbing other radio observations and HF radio communications. The continuous observation at a fixed frequency 2.6 MHz shows periodic variations in the virtual height and echo intensity with periods of one to several tens of minutes. Periodic variations with a period of several tens of minutes may indicate a propagation of excitation of internal gravity waves during a geomagnetically quiet period, while a variation with a period of 1 min could be caused by an oscillatory precipitation of energetic auroral particles. Stewart, R.D., Rodger, A.S., Dudeney, J.R., **Thermospheric wind response to driving forces in the vicinity of the Harang discontinuity,** *Planetary and space science,* Feb. 1988 36(2), p.225-229, 15 refs.

Fabry-Perot interferometer Doppler measurements of the 6300 Å oxygen emission line have been used to determine the neutral thermospheric wind over Halley Station. Simultaneous measurements of the local magnetic field have been used to generate a time frame with respect to the passage of the Harang discontinuity across the observing station. This identifies the night-time divergence in the dawn and dusk ion convection cells. Neutral wind measurements in this "Harang" time frame have shown a significantly higher degree of ordering than when considered in universal time. In particular, a reduction in the meridional component of the neutral wind is observed near the time of the discontinuity. This may be explained by a local reduction in Joule heating or through coupling to divergent convecting ions at the Harang discontinuity. The zonal component wind data show a marked transition from eastward to westward near 23:00 U.T., but there are no effects attributable to the Harang discontinuity. This transition arises because Halley moves from a regime where solar e.u.v. driven winds dominate to one where ion-drag is the most important driving force. This is supported by the dependence of the transition time on the level of local geomagnetic activity. (Auth.)

Cravens, T.E., Killeen, T.L., **Longitudinally asymmetric transport of nitric oxide in the *E*-region,** *Planetary and space science,* Jan. 1988 36(1), p.11-19, Refs. p.18-19.

Rocket and satellite studies have demonstrated that nitric oxide (NO) in the thermosphere is almost always more abundant at higher than at lower latitudes. The ultraviolet NO spectrometer (UVNO) on the *Atmosphere Explorer C* spacecraft observed longitudinal asymmetries in thermospheric NO with greater abundances existing in the longitudinal sector associated with the magnetic poles of both hemispheres. This asymmetry persists even in geomagnetic coordinates. In this paper, an explanation is suggested for the longitudinal asymmetry, using neutral parcel trajectories calculated from the NCAR thermospheric general circulation model. It is evident from a study of these calculated trajectories that certain longitudes are favored for equatorward transport out of the auroral zone in the *E*-region. These favored longitudes are those associated with the magnetic poles, where NO is most abundant. (Auth.)

Troshichev, O.A., Gusev, M.G., Nikolashkin, S.V., Samsonov, V.P., **Features of the polar cap aurorae in the southern polar region,** *Planetary and space science,* May 1988 36(5), p.429-439, 33 refs.

Data of the all-sky camera and photometer at Vostok Station in the antarctic nearpole region have been used for analysis of the auroral features in the southern polar cap. It is shown that the sun-aligned arcs appear in the polar cap with a delay time of about an hour relative to the northward turning of the IMF and that they can remain for many hours provided the IMF is invariable. The distribution of these aurorae in the dayside polar cap displays a *theta*-shaped pattern which is clearly separated from the latitude-oriented arcs in the auroral oval. Disappearance of the sun-aligned arcs after the southward turning of the IMF occurs in 10-15 min. The observation of the polar cap arcs immersed in a wide band of diffuse luminescence implies that the sun-aligned arcs should be located within the *theta*-aurora transpolar band. It is concluded that the distribution of the aurorae in the polar cap, auroral oval and in the day-side cusp requires a closed structure for the magnetosphere. The convection pattern corresponding to a closed magnetosphere suggests the formation of closed cavities with a stagnation plasma regime in the distant tail of the magnetosphere. (Auth.)

Troshichev, O.A., Voloshinov, N.N., **Effects of magnetic activity and interplanetary magnetic field on the position of radioaurorae in the southern polar region,** *Planetary and space science,* May 1988 36(5), p.441-448, 16 refs.

The results of a statistical analysis based on the data of the Davis Base radar experiment for the period June-December 1982 are given. It is shown that radio aurorae display the position of the cleft region. The location of the cleft is affected by the IMF aspect angle component and not by the *AE* index: the cleft is displaced toward the equator when aspect angle turns toward the South. The probability of the daytime radioaurorae increases and the second maximum of radioaurorae appears in the morning hours when the Davis Station index grows. (Auth.)

Funaki, M., Wasilewski, P., **Preliminary studies of natural remanent magnetization of the rocks collected from Ongul Islands, East Antarctica,** *Tokyo. National Institute of Polar Research. Memoirs,* 1986 Special issue No.43, Symposium on Antarctic Geosciences, 6th, 1985. Proceedings, p.37-47, 21 refs.

331 rock samples collected from East and West Ongul Islands were studied paleomagnetically. Pyroxene gneiss and the majority of the garnet gneisses have unstable natural remanent magnetization (NRM), whose directions are similar to the present geomagnetic field in the Showa Station area. These unstable NRMs can be related to the existence of pyrrhotite. Hornblende gneiss, the other garnet gneisses, granite, amphibolite, siliceous rocks and pegmatite dykes have stable NRM. Magnetic carriers in stable rocks are considered to be iron oxide minerals (magnetite and hematite). The formations over a wide area of the Lützow-Holm Bay region were magnetized at the final stage of metamorphism about 480 Ma ago in a reversed geomagnetic field direction, then granite intrusions occurred during a period of normal geomagnetic field conditions. The time interval of this sequence may not be very long from the consideration of virtual geomagnetic pole (VGP) positions. Our result of VGP positions 20.2 S, 20.7 E supports previous paleomagnetic results obtained from the Lützow-Holm Bay region and from East Antarctica for early Paleozoic time. VGP positions are located in low latitudes near the present-day Africa. (Auth.)

Elston, D.P., Bressler, S.L., **Paleomagnetic stratigraphy,** *New Zealand. Department of Scientific and Industrial Research. Bulletin,* 1986 No.237, Antarctic Cenozoic history from the MSSTS-1 drillhole, McMurdo Sound, edited by P.J. Barrett, p.109-114, 6 refs.

The remanent magnetization of much of the section recovered in core hole MSSTS-1 drillhole is stable and appears to reflect the ambient field direction at the time of deposition. However, two intervals, 147-165 m and 186-200 m, contained secondary or unstable magnetizations. This, and six major intervals from which no core was recovered, seriously compromised development of a polarity zonation useful for direct correlations with parts of the polarity time scale. Nonetheless, a correlation with the polarity time scale for the late Oligocene has been proposed for the section below 116 m employing a diatom zonation. (Auth.)

Herrod, L.D.B., Garrett, S.W., **Geophysical fieldwork on the Ronne Ice Shelf, Antarctica,** *First break,* Jan. 1986 4(1), p.9-14, 6 refs.

Reconstructions of Gondwanaland, the concept of a single landmass uniting all southern continents, recognize the central position of Antarctica relative to the other land fragments. Complex geological structures in the apparent overlap of South America and the Antarctic Peninsula point out the critical nature of the Ronne Ice Shelf to the understanding of the development of West Antarctica. To learn more of the nature and geophysical characteristics of the Ronne Ice Shelf, surveys are made to measure ice thickness, gravity, geomagnetism, seismicity, geodesy, and other physical parameters. These measurements and the logistics necessary to support field survey parties, both airborne and over ice traverses, are described and discussed.

Courtney, R.C., Recq, M., **Anomalous heat flow near the Crozet Plateau and mantle convection,** *Earth and planetary science letters,* Sep. 1986 79(3/4), p.373-384, 39 refs.

A heat flow study has been performed near the Crozet Plateau (southern Indian Ocean), where the geoid and bathymetry are anomalously high with respect to the nearby deep ocean basins. Data collected on a 67 Ma old oceanic crust agree with simple plate model predictions at the stations furthest removed from the plateau. Heat flow values increase significantly towards the center of the feature, suggesting a thermal origin for this uplift. The ratio of geoid to bathymetry confirms that simple crustal thickening with Airy local compenstion cannot explain the observations. The data are compatible with a model of dynamic convective support of the plateau by an underlying thermal plume in the earth's mantle. (Auth.)

Adams, R.D., Akoto, A.M., **Earthquakes in continental Antarctica,** *Journal of geodynamics,* Dec. 1986 6(1-4), p.263-270, 4 refs.

No earthquake had been definitely located in the interior of the antarctic continent before that in Queen Maud Land, which occurred on Nov. 4, 1982, and was found by the "search" procedure of the International Seismological Centre. A further earthquake of similar magnitude *(Mb* 4.4) has now been located about 200 km inland from the coast of Wilkes Land, near 69 S, 123 E. The second event occurred on Sep. 20, 1983, and was also found by the ISC search procedure, from readings at 4 antarctic seismograph stations, and six farther afield. Reflected phases suggest that the focus of this earthquake is in the upper few kilometers of rock beneath the ice cap. Two later earthquakes occurred on May 19, 1984 about 400 km west of the 1983 event. Magnitudes *(Mb)* of 5.0 and 4.6 were recorded, large enough to be located by the US National Earthquake Information Service. (Auth.)

Ikami, A., Ito, K., **Crustal structure in the Mizuho Plateau, East Antarctica, by a two-dimensional ray approximation,** *Journal of geodynamics,* Dec. 1986 6(1-4), p.271-283, 17 refs.

A seismic experiment along a 300 km line, with 3 shots and 27 observation stations, was successfully made in the northern Mizuho Plateau. From the analysis of travel times and the amplitude study of synthetic seismograms, the crustal structure of the northern Mizuho Plateau was determined. The depths of the Conrad and the Moho discontinuities were determined as 31 km and 42 km, respectively. The P-wave velocity and depth relation was determined as 6.0 km/s on the surface of the bedrock, 6.3 km/s at a depth of 2 km, 6.8 km/s at the Conrad and 7.9 km/s at the Moho. The velocity in the crust increases gradually. The crustal structure obtained is representative of East Antarctica. (Auth. mod.)

Ito, K., Ikami, A., **Crustal structure of the Mizuho Plateau, East Antarctica, from geophysical data,** *Journal of geodynamics,* Dec. 1986 6(1-4), p.285-296, 22 refs.

The crustal structure between Showa and Mizuho stations is modeled from the gravimetric data and radio echo soundings of bedrock elevations, so as to fit the P-wave velocity structure derived from the data of explosion seismic experiments. The structure is extended from Showa Station seaward, across Lützow-Holm Bay, and from Mizuho Station southeastward, inland, where only gravimetric data are available. Thus, a crustal section about 600 km long is obtained on a margin of East Antarctica. The depth of the Moho increases by about 7 km from Showa Station to the point Y200 (71 deg 46 S, 48 deg 56 E), about 500 km from the coast. A graben-like structure is obtained along the line across Lützow-Holm Bay. This suggests that both sides of the bay are bounded by faults. (Auth. mod.)

Nagao, T., Kaminuma, K., **Long-term underground temperature measurements at Syowa Station, East Antarctica,** *Journal of geodynamics,* Dec. 1986 6(1-4), p.297-308, 25 refs.

Underground temperature measurements in 2 shallow boreholes were carried out at Showa Station from Apr. 1981 to Jan. 1985. Two quartz thermometers were installed in the first borehole, at depths of 2 and 5 m, respectively, and 3 in a second, at depths of 1, 4 and 6.8 m, respectively. Mean underground temperatures in the first borehole were -8.181 and -8.843 C, at depths of 2 and 5 m, and in the second -8.242 and -8.220 C, at depths of 4 and 6.8 m. As the mean air temperature at Showa Station was -10.8 C, the underground temperature in the 2-6.8 m depth range is about 2 deg. higher than the air temperature. The thermal conductivity of the drilled cores and surrounding outcropping rocks are also measured by the transient method with temperature conditions at +23 C and -20 C. The thermal conductivities measured in various samples at -20 C are about 7% larger than those at +23 C. This tendency is consistent with the results of holocrystalline rock experiments. (Auth. mod.)

Bormann, P., **Structure and development of the passive continental margin across the Princess Astrid Coast, East Antarctica,** *Journal of geodynamics,* Dec. 1986 6(1-4), p.347-373, Refs. p.372-373.

On the basis of geological and geophysical data, a contribution is made to understanding the structure and evolution of the Earth's crust across the Princess Astrid Coast, especially in the area of the Schirmacher Ponds and the Wohlthat Massif. The crustal material is mostly composed of medium- to high-grade metamorphics which underwent three important tectogenic events (close of the Archaean,

within the Proterozoic and at the close of the Precambrian). The intrusive age of the Eliseev Anorthosite Massif was determined (2,400 Ma). The dominant structural features in the Schirmacher Ponds show a strike of some 40 to 60 deg and indicate a NNE-SSW oriented compressional stress regime. It is probably connected with the last major thermotectonic event some 400 to 600 Ma ago. The Phanerozoic history is controlled by the younger Gondwana break-up and N-S oriented tension. The continental crust as a whole is of relatively acid composition. This is also reflected in the negative regional magnetic anomaly. Probably, its origin is linked to late Precambrian thermotectonic activation. A typical feature is the crustal thinning to the north (from some 50 to 20 km) in connection with deep-reaching E-W crustal faults indicating northward down-faulted blocks. (Auth.)

Shibuya, K., Kaminuma, K., **Aeromagnetic survey around Syowa Station, East Antarctica,** *Journal of geodynamics,* Dec. 1986 6(1-4), p.387-389, 6 refs. Extended abstract.

Survey flights were conducted over the Lützow-Holm Bay, Yamato Mountains, Shirase Glacier, Mizuho Plateau and several long-distance profiles to Enderby Land, in 1980-1984. The area is covered by comparatively dense survey profiles. The flight logs, data acquisition system, diurnal variation observed during the survey flights, and the total intensity data obtained are compiled and reported regularly in JARE Data Report, Earth Science Series. The regions concerned are covered by the auroral zone and short-period time variation of the geomagnetic field is sometimes so large as to change by 200-300 nT in 2-3 hrs. Survey Flights are usually planned during geomagnetically quiet times with Kp index less than 1. (Auth. mod.)

Von Frese, R.R.B., Mateskon, S.R., **Modeling magnetic and gravity effects of the Transantarctic Mountains,** *Antarctic journal of the United States,* 1985 20(5), p.1-3, 2 refs.

A 3-year program, initiated on Apr. 1, 1985, which involves developing the capacity to model magnetic and gravity anomalies over a spherical earth for verifying and detailing geological analyses of the regional anomaly fields, is discussed. The procedure implemented for this purpose, and its modification, is described as being used to compute, in spherical coordinates, the regional geopotential anomaly fields of the Transantarctic Mountains to separate these effects from the anomalies of deeper lithospheric sources which are the focus of the investigation. Preliminary results include magnetic and gravity analyses for a portion of the mountain range. Gravity terrain corrections relative to the Bouguer slab reduction at each grid node of the topographic surface are given.

Kaminuma, K., Shibuya, K., Niida, K., **Geophysical studies on Mount Erebus,** *Antarctic journal of the United States,* 1985 20(5), p.28-30, 9 refs.

Continuous seismic observations have been carried out since December 1980 showing that new volcanic activities of Mount Erebus commenced on Sep. 13, 1984. From 5 to 19 large explosions were clearly recorded at Scott Base each day from Sep. 13 to 24, increasing from Sep. 25 to 29 (12 to 31 per day). About 20 explosions per day on average occurred in Oct. and 15 per day in Nov. A new type of eruption which can be suitably called a gas-jetting eruption, commenced on Dec. 3, and the large eruptions began to cease at the same time. The seismic activity observed on and around Mount Erebus is summarized. To reveal the structure of the Erebus volcano, especially to confirm the existence of the magma reservoir, explosion seismic measurements were carried out in Dec. 1984. All 7 explosions, listed in a table, produced excellent records. Five new gravity stations, established on Ross I. during the 1984-1985 austral summer, obtained gravity values with higher accuracy than the data measured in the last season. To enhance the study of the structure of McMurdo volcanoes using both geophysical and geological methods, field studies were made on the volcanic rocks and the xenoliths during the 1984-1985 austral summer at Crozier, Hut Point Peninsula, and Black I. The purpose of the geological field work at these volcanic sites was to study and collect xenoliths.

Cherry, E.M., Noltimier, H.C., **Paleomagnetism and hydrothermal alteration: Kirkpatrick Basalt Group, Victoria Land,** *Antarctic journal of the United States,* 1985 20(5), p.32, 12 refs.

Detailed alternating field (AF) and thermal demagnetization experiments were conducted on 11 Kirkpatrick Basalt Group (KBG) flows from the Mesa Range area, and on 5 KBG flows and one Ferrar Dolerite Group sill from Gorgon Peak. Results indicate that the natural remanent magnetization contains a significant component of chemical remanent magnetization (CRM). Hydrothermal alteration has resulted in the incomplete low temperature oxidation of titanomagnetite to titanomaghemite. Both of these phases have the spinel structure, and thus, have similar magnetic properties and exhibit a similar response to AF demagnetization. It is suggested that it is not likely that the presence of CRM in the Ferrar Supergroup rocks will significantly alter mean Jurassic virtual geomagnetic pole for the Transantarctic Mountains, because late state hydrothermal alteration will have the effect of averaging secular variation. However, this CRM component is strong enough to overprint primary reversals in the thermoremanent magnetization that are useful in intra- and inter-regional correlations.

Matsumoto, T., Segawa, J., Kaminuma, K., **Distribution of Bouguer gravity anomaly and crust and upper mantle in the antarctic region,** *Antarctic record,* Nov. 1986 30(3), p.149-163, In Japanese with English summary and captions. 21 refs.

Bouguer anomaly in the Antarctic Continent presents negative anomaly, showing that the land area is in isostatic equilibrium with the thick crust supporting the load of both thick ice sheet and bedrock topography. In the surrounding ocean area there is a zone of relatively negative anomaly corresponding to the mid-oceanic ridges. The result of further analysis shows that there is some relationship between the sub-bottom structure of the Ross Sea and that of mid-oceanic ridges, and that no clear boundary of lithosphere and asthenosphere is recognized, which suggests that the asthenosphere reaches up to the bottom of the crust in this area. (Auth. mod.)

Fukuda, Y., **Gravimetric connection between Asuka Camp and Syowa Station, with gravity survey on Rundvågshetta,** *Antarctic record,* Nov. 1986 30(3), p.164-174, In Japanese with English summary and captions. 3 refs.

Gravimetric connection between Asuka Camp and Showa Station was established during the summer activities of JARE-27. Gravity measurements were carried out by using two LaCoste-Romberg gravimeters models G-477 and -805 at Asuka Camp on December 27th and 28th, 1985, and also at Showa Station in early January, 1986. Although the gravimetric connection was achieved only one way, data analyses were carried out successfully using all other gravity measurements during JARE-27 to detect drift rates and other instrumental parameters. The gravity values at Asuka Camp were determined relative to the value at Showa Station with an accuracy of 0.2 mgals. Although it is not satisfactory compared with the recent precise gravity measurements, the accuracy is reasonable considering rather hard situations of the gravity measurements in Antarctica. Another gravity survey was carried out on Rundvågshetta in late January, 1986. Eight gravity stations, including five triangulation stations, one astro-geodetic station and other points, were newly established in the area. The results of the survey are reported briefly. Lawver, L.A., Bergh, H., Barker, P.F., **Evolution of the far South Atlantic during the Late Cretaceous,** *Antarctic journal of the United States,* 1985 20(5), p.88-90, 9 refs.

During the summer of 1983, a collaboration was begun with the goal of merging unpublished University of Birmingham marine geophysical data with similar data that had been collected along the American Antarctic Ridge and with all the pertinent National Geophysical Data Center profiles. With the addition of the British soundings, ridge segments and transform faults have been located, and offridge area contouring, correlation and identification of magnetic anomalies, and determination of direction and spread rate along the American Antarctic Ridge during the past 45 million years are possible. A triple junction model has been developed which shows that some of the magnetic anomalies, formed between 82 to 65 million years ago at the South American/Antarctic plate boundary, should now be found southeast of the Falkland Plateau.

Murakami, M., Tajima, K., Funaki, M., **International gravimetric connections along the Circum-Pacific zone. 4. Drift characteristics of LaCoste & Romberg gravimeters (Model G),** *Geodetic Society of Japan. Journal,* 1983 29(3), p.141-149, In Japanese with English summary. 4 refs.

The drift of LaCoste & Romberg gravimeters (model G) was thoroughly examined, using data obtained by the international gravimetric connections which were carried out at selected cities, mainly along the Circum-Pacific zone and including McMurdo Sound, from 1979 to 1982. It was clearly recognized that positive and negative drifts of some gravimeters occurred when the gravimeter was brought from cities with large and small gravity values, respectively. Generally speaking, cities with large gravity values are cooler, while those with small values are warmer. Such a pronounced tendency to drift could be explained by an elastic property of the springs inside of the gravimeter. It is difficult to conclude, at present, which affects the drift of the gravimeter more: ambient temperature or gravity value of measuring stations. (Auth. mod.)

Comptes rendus hebdomadaires des séances. Série 2,* Dec. 19, 1983 297(13), p.903-908, In French with English summary. 21 refs.

DLC QD1.A26

In Mar. 1983, seismic refraction profiles were carried out on the ground for the first time in the Kerguelen archipelago. Preliminary results from first arrival studies show that the thickness of the crust is only 15 km beneath the eastern area and increases toward the center of the archipelago. The seismic velocity vs. depth distribution is similar to those of oceanic aseismic ridges (i.e. Crozet and Madagascar Ridges). These preliminary data on the deep structure of the crust favor the hypothesis of an oceanic origin for the Kerguelen Is. and for the Kerguelen-Heard submarine Plateau. (Auth.)

Simmons, D.A., **Measurement of declination at South Georgia, 1700-1984,** *Polar record,* Jan. 1987 23(145), p.419-426, 22 refs.

Declination, or the difference between true and magnetic north, is one of the earliest parameters to have been measured systematically over the earth's surface. Values are available for South Georgia and the surrounding area from 1700 to the present. Observations were made from ship by Edmond Halley in 1700, by James Cook in 1775 and thereafter more frequently. Land-based observations were made

during the First Polar Year in 1882-3, more recently by the British Antarctic Survey 1975-82. Declination has diminished from 23 E in 1700 to about 9 W in 1980, approximately 0.1 deg per annum. The modern observations suggest that the rate of change has slowed in recent years. (Auth.)

Rooney, S.T., Blankenship, D.D., Bentley, C.R., **Seismic refraction measurements of crustal structure in West Antarctica,** *American Geophysical Union. Geophysical monograph series,* 1987 No.40, Gondwana Six: structure, tectonics, and geophysics. Edited by G.D. McKenzie, p.1-7, 5 refs.

Two seismic refraction profiles yield new information about the crustal structure of West Antarctica. One profile on the Ross Ice Shelf grid northwest of Crary Ice Rise shows basement rock with a compressional wave velocity of 5.9 km/s underlying a layer of presumed sediment about 400 m thick. The irregular basement surface lies about 1.0 km below sea level and has an average apparent dip of 1 deg to the grid north. The second profile, on the Siple Coast, reveals 1 to 2 km of sediment overlying a basement that has an apparent dip of 4 deg to the grid southeast. An abrupt 2-km decrease in depth to basement within the profile is interpreted as being due to faulting. Deep reflections were observed on one record at 50 km, but data are insufficient for identification of their source. (Auth.)

Von Frese, R.R.B., Hinze, W.J., Olivier, R., Bentley, C.R., **Satellite magnetic anomalies and continental reconstructions,** *American Geophysical Union. Geophysical monograph series,* 1987 No.40, Gondwana Six: structure, tectonics, and geophysics. Edited by G.D. McKenzie, p.9-15, 16 refs.

Regional magnetic anomalies observed by NASA's magnetic satellite mission over the eastern Pacific Ocean, North and South America, the Atlantic Ocean, Europe, Africa, India, Australia, and Antarctica are adjusted to a fixed elevation of 400 km and differentially reduced to the radial pole of intensity of 60,000 nT. Having been normalized for differential inclination, declination, and intensity effects of the core field, these radially polarized anomalies in principle directly map the geometric and magnetic property variations of sources within the lithosphere. When plotted on an Early Cambrian reconstruction of Gondwanaland, many of the radially polarized anomalies of the continents demonstrate detailed correlation across the continental boundaries to verify the prerift origin of their sources. Accordingly, these anomalies provide fundamental constraints on the geologic evolution of the continents and their reconstructions. (Auth. mod.)

Garrett, S.W., Herrod, L.D.B., Mantripp, D.R., **Crustal structure of the area around Haag Nunataks, West Antarctica: new aeromagnetic and bedrock elevation data,** *American Geophysical Union. Geophysical monograph series,* 1987 No.40, Gondwana Six: structure, tectonics, and geophysics. Edited by G.D. McKenzie, p.109-115, 25 refs.

Five thousand line kilometers of new airborne geophysical data are presented from the area between the Antarctic Peninsula and Ellsworth Mountains. The southernmost end of the Antarctic Peninsula shows isolated aeromagnetic anomalies of over 400-nT amplitude which correspond to discrete plutonic bodies. The central area of Fowler Peninsula shows a continuous zone of high-amplitude (600 nT) short-wavelength (5 km) anomalies attributed to metamorphic rocks which outcrop beneath the ice cover. This interpretation is supported by measurements of the magnetic properties of Precambrian rocks exposed at Haag Nunataks. Anomalies of up to 400-nT amplitude and 50-km wavelength suggest a magnetic basement between 5 and 15 km below Evans Ice Stream, Carlson Inlet, Fletcher Promontory, and Rutford Ice Stream. A correlation of steep bedrock scarps, magnetic anomalies, and depth to magnetic sources indicates major faults delimiting horst and graben structures formed during northeast to southwest extension. Marsz, A.A., **Tentative assessment of the rate of isostatic movement on the Admiralty Bay shores on King George Island of the South Shetland Islands, West Antarctica,** *Quaestiones geographicae,* 1983 (Pub. 1985) Vol.9, p.99-106, 8 refs.

DLC G1.Q3

The article attemps to assess the rate of isostatic movement that takes place on King George I., the largest of the South Shetland Is. Field studies were carried out in two sectors of the Admiralty Bay shores. The estimated rate of uplift ranges between about 11.5 mm a year (a minimum rate) and 21-22 mm a year (a maximum rate). The actual rate of the Admiralty Bay shore uplift seems to approach the upper value of the interval, i.e. about 21-22 mm annually and is identical for both bay shores. Analysis of the pattern of beach ridges indicates that the rate of isostatic uplift has become more rapid in the last several tens of years than before. (Auth.)

McIntosh, W.C., Sutter, J.F., **Paleomagnetic results from the Kirkpatric Basalt Group, Mesa Range, north Victoria Land, Antarctica,** *American Geophysical Union. Antarctic research series,* 1986 Vol.46, Geological investigations in northern Victoria Land, edited by E. Stump, p.289-303, 30 refs.

Sixty samples from 15 Jurassic Kirkpatrick Basalt Group flows in the Mesa Range, north Victoria Land, were studied paleomagnetically using alternating field and thermal demagnetization. The magnetic mineralogy was examined using reflected light microscopy and thermomagnetic analysis. All of the samples show strong, stable, normal remanence interpreted as a primary thermoremanent magnetization carried by titanomagnetite; components of secondary remanence were minor. Small components of viscous magnetization were readily removed by AF demagnetization in fields of 20 mT. Samples from 14 flows are free from components of chemical remanent magnetization (CRM); samples from the fifteenth flow exhibit a minor CRM component in a reversed direction. The mean virtual geomagnetic pole of the Mesa Range samples lies significantly south of the mean paleomagnetic pole reported from Jurassic rocks elsewhere in Antarctica. (Auth. mod.)

Blankenship, D.D., Anandakrishnan, S., Kempf, J.L., Bentley, C.R., **Microearthquakes under and alongside Ice Stream B, Antarctica, detected by a new passive seismic array,** *Annals of glaciology,* 1987 Vol.9, Symposium on Remote Sensing in Glaciology, 2nd, Cambridge, Sep. 8-9 and 11-12, 1986. Proceedings, p.30-34, 15 refs.

A new seismographic array with a band width of 500 Hz per channel and a dynamic range of 96 dB was developed for detecting natural events on glaciers. It was first deployed on ice stream B during the 1985-86 austral summer. The network consists of nine solar-powered seismographs, each monitoring three components of ground motion. Each of the seismographs is connected by up to 4 km of fiber-optic cable to a central node where seismic events are both detected and recorded. During 85 h of passive seismic monitoring on ice stream B, 25 microearthquakes were observed. Sixteen of these events were associated with shallow crevassing, mostly near the margins, although not within the zones of extreme shearing that bound the ice streams. Nine microearthquakes were associated with low-angle thrusting near the base of the ice stream. The principal initial result of these passive seismic studies is the demonstration that virtually none of the energy dissipated beneath ice stream B takes place through brittle fracture near the base. Nevertheless, fracture associated with microearthquakes may play a significant role in sub-glacial erosion. (Auth.)

DLC QE350.A567 1987

Using multichannel seismic data collected in 1984 three unconformities are defined, the two deepest of which are associated with rifting and continental breakup. A breakup unconformity terminates at the oldest oceanic crust, and a deeper unconformity, erosionally truncates strata of the deepest of the four sedimentary sequences. The deepest sequence is well stratified and block faulted and is interpreted as prerift continental strata. A shallow-dipping reflector under the block faults may represent a décollement surface; it intersects the Moho near the oceanic crust boundary. A marginal rift basin, about 40 km wide, lies adjacent to the edge of oceanic crust and is interpreted as a remnant rift valley. The floor of the marginal rift basin is about 3 km deeper than the adjacent oceanic crust, and the basin is filled with steeply prograded clastic sediments. The extent of crustal thinning across the transition zone is calculated. Under the midcontinental rise the model infers thinning by a factor of 1.7 and in the region of the marginal rift basin, thinning is inferred to be a factor of 5 and greater. (Auth. mod.)

DLC QE350.A567 1987

A strong subbottom reflection from the crust-mantle interface extends from below oceanic crust to under the continental crust of Antarctica for more than 80 km. Based on interpretations of seismic-reflection profiles, it is proposed that during lithospheric extension hot mantle material (foliated peridotite) rose as a dike-like body to the base of the continental crust. As the newly emplaced mantle material widened, the continental crust was thinned by low-angle detachment faults that transported slabs of crustal material from both opposed plates directly onto the new mantle. The dike of mantle material continued to widen and to intrude to progressively shallower depths, and when the intrusion reached a critical subsurface depth, the weight of the remaining thin cover of continental crust at the toes of the slides was small enough to permit partial melting of the mantle peridotite to form basaltic magma. Subsequently, a rift broke through to the surface, and basaltic oceanic crust began to form. The new oceanic crust then extended to accommodate plate separation, and while spreading continued in the middle of the belt of oceanic crust, an essentially unfaulted layer of sediment was laid down across the continent-ocean boundary. Marine refraction, gravity, and magnetic data from the Wilkes Land margin of Antarctica are used with multichannel seismic profiles to model the crustal structure over the continent-ocean boundary (COB) of this passive margin. The crustal types encountered in the study include normal oceanic crust, marginal rift-basin crust, and thinned continental crust. The latter two crustal types comprise the crustal transitional zone, which extends approximately 35 km landward of the COB and is characterized by heterogeneous velocity structure. Gravity models suggest that the transitional zone is underlain by a body that is slightly less dense (3.15 g/cu cm) than typical for mantle material. Inconsistencies between the sonobuoy data from the Wilkes Land margin and similar data from the corresponding conjugate margin of southern Australia are noted. (Auth.)

DLC QE350.A567 1987

A distinctive pattern of geophysical anomalies delimits and characterizes a magnetic quiet zone situated over the continental slope and rise. The data document that the quiet zone is fundamentally different from the ocean basin to the north and the continent to the south. The pattern of geophysical anomalies off Wilkes Land, Antarctica, shows a remarkable degree of similarity to the pattern of gravity, magnetics, and seismic data observed on the southern continental margin of Australia. This similarity is the basis for extending the interpretation of the Australian quiet zone as overlying the remnant of a fossil rift system to the conjugate quiet zone off Wilkes Land. The new reconstruction is less tight than those previously proposed, for it includes the 250 km wide rift zone as it existed just prior to continental breakup. The fit further avoids any overlap of continental material and fully satisfies the geologic constraints governing the reassembly of Australia and Antarctica. (Auth. mod.)

Kalamarides, R.I., Berg, J.H., Hank, R.A., **Lateral isotopic discontinuity in the lower crust: an example from Antarctica,** *Science,* Sep. 4, 1987 237(4819), p.1192-1195, 23 refs.

The lower continental crust is one of the least known variables in the crust-mantle evolutionary equation. In order to study the nature and compositional heterogeneity of the lower crust, more than 20 inclusions of lower crustal granulites in volcanic rocks from the McMurdo Sound region of Antarctica were analyzed for strontium and oxygen isotopes. These inclusions were erupted from volcanic centers covering an area of 12,000 sq km. Along with results from analyses of major and trace elements, the isotopic data reveal a profound discontinuity in the composition and probably the age of the lower crust that coincides with the boundary between the Transan-

tarctic Mountains and the Ross Embayment. Although this topographic boundary between East and West Antarctica is largely a cenozoic development, which apparently reflects a simple subvertical faulting relationship due to crustal rifting, the isotopic differences in the lower crust across the boundary suggest that the current faulting and rifting may coincide with an older crustal suture, the age of which is uncertain. DLC QE350.A568 1987

New gravity and bathymetry maps are presented for the west and central Ross Sea. The gravity data show a large negative anomaly trending north-south along the axis of the Victoria Land basin. Gravity models demonstrate that this negative anomaly can be accounted for by increased water depth and thicker low density and velocity sediments along the basin axis, as noted on seismic data. The gravity models also indicate that thin crust lies under the basin. This thin crustal section thickens rapidly at the coast between McMurdo Sound and Cape Washington to about 40 km under the Transantarctic Mountains. The northern boundary of the Victoria Land basin near Cape Washington marks the northern boundary of the region of thin crust. This coincidence suggests that the thin crust formed as a result of extensional tectonics associated with the older, major episode of basin formation of the Victoria Land basin rather than with the younger extensional episode causing active rifting along the basin axis. Gravity models over Iselin Bank show a crustal thickness of 21-24 km. Several graben structures occur on top of the bank, trending parallel to the axis of the bank. A sedimentary trough and associated thinned crustal section indicate extensional tectonics has occurred off the western margin of the bank. (Auth.)

DLC QE350.A568 1987

Temporal magnetic variations have been successfully removed from marine magnetic gradiometer data recorded on both the Wilkes Land and Ross Sea segments of the U.S. Geological Survey 1984 antarctic continental margin survey. Gradiometer data reconstruction techniques have been applied to remove the short-period time variations (up to about 5 hours) from the data and thereby eliminate many false anomalies. Time variations removed from the marine magnetic data and those recorded in magnetograms at the Scott Base observatory show close agreement and confirm that the gradiometer reconstruction technique correctly recognizes short-period time variations. It is concluded that time-variation magnetic anomalies recorded in marine magnetic data can be accurately identified and separated from geologically derived anomalies using a gradiometer system. This technique is of particular importance in the Antarctic, where storm activity is severe, and base station data is of limited use in removing time-variation anomalies.

DLC QE350.A568 1987

Marine magnetic gradiometer measurements allowed compilation of total magnetic-intensity profiles corrected for temporal magnetic variations. The western and eastern boundaries of the Victoria Land basin, as well as the central Lee arch in the active Terror rift zone, are characterized by short-wavelength (200-1400 nT) 1-5 km wide anomalies that are interpreted as volcanic in origin. Theoretical anomalies support the interpretation that submarine volcanoes and associated subvolcanic intrusions penetrate the sedimentary section. Magnetic and seismic data near Granite Harbour at the west side of the VLB suggest a submarine caldera with a volcanic dome and associated intrusion. This implies active or Holocene volcanism because of an inferred nonmagnetic core. The Terror rift has a 100 km wide negative regional anomaly of about 100-nT amplitude with a relative positive anomaly over the Lee arch on two profiles. Magnetic models suggest that basement relief beneath the thick sedimentary section in the graben and an upwarping of the Curie isotherm beneath the arch may both contribute to the source of the anomaly. The east side of Iselin Bank, at the continental shelf edge, is marked by an apparently linear step-like 200-nT magnetic anomaly, positive over oceanic crust. Magnetic models controlled by multichannel seismic-reflection and sonobuoy refraction data imply that this anomaly is caused by highly magnetic oceanic crust contrasted to more weakly magnetized continental crust of Iselin Bank. DLC QE350.A568 1987

The western Ross Sea is the site of various tectonic processes: subsidence of Ross Embayment; rapid uplift of the Transantarctic Mountains; and Cenozoic through Recent volcanism. Several plate tectonic reconstructions require relative motion between East and West Antarctica, perhaps by extension and rifting in the Ross Sea. These processes could account for regionally anomalous thermal conditions in the lower crust or upper mantle. Heat flow was measured at two locations in the western Ross Sea. The results, combined with previously published measurements in the Ross Embayment, indicate that there is greater than average heat flow in this area. Although the data coverage is sparse, it is apparent that somewhat anomalous thermal conditions exist in the area and may be related to the observed tectonic structure of the Ross Embayment. (Auth.)

McGibbon, K.J., Garrett, S.W., **Magnetic anomalies over the Black Coast, Palmer Land,** *British Antarctic Survey. Bulletin,* Aug. 1987 No.76, p.7-20, 30 refs.

Regional aeromagnetic data gathered over eastern Palmer Land reveal a north-south aligned cluster of short-wavelength (10-20 km), large-amplitude (800-2000 nT) anomalies which may be modelled using shallow bodies of 10 km width and high magnetization (>5 A/m). A ground magnetic survey targeted on these features revealed complex anomaly patterns with high amplitudes (>6000 nT) which

were interpreted using three-dimensional techniques. The source bodies are a distinctive suite of mafic intrusions of (?)Cretaceous age. (Auth.)

Forsyth, D.W., Ehrenbard, R.L., Chapin, S., **Anomalous upper mantle beneath the Australian-Antarctic discordance,** *Earth and planetary science letters,* Aug. 1987 84(4), p.471-478, 27 refs.

Within the Australian-Antarctic discordant zone, residual depth anomalies approach 100 m. In sea floor younger than 10 Ma that is more than 500 m deeper than expected, Rayleigh wave phase velocities are significantly faster than in sea floor of comparable age in the Pacific. In this area, the shear wave velocity in the 20-40 km depth range is unusually fast, indicating that the lithosphere develops more rapidly than usual from an asthenosphere that is perhaps cooler than average. Beneath this older sea floor, the low-velocity zone in the oceanic mantle is much less pronounced than beneath sea floor of comparable age in the Pacific. (Auth.)

Bachtadse, V., Van der Voo, R., Hälbich, I.W., **Paleomagnetism of the western Cape Fold belt, South Africa, and its bearing on the Paleozoic apparent polar wander for Gondwana,** *Earth and planetary science letters,* Aug. 1987 84(4), p.487-499, 42 refs.

In order to test two different proposals for the poorly defined African Paleozoic apparent polar wander path (APWP), a paleomagnetic study was carried out on Ordovician through Carboniferous clastic sediments from the Cape Fold belt, west of the 22nd meridian. One proposal involves a relatively simple APWP connecting the Ordovician Gondwana poles in North Africa with the Late Paleozoic poles to the east of South Africa in a more or less straight line crossing the present equator in the Devonian. The other proposal adds a loop to this path, connecting Ordovician poles in North Africa with poles to the southwest of South Africa and then returning to central Africa. This loop would occur mainly in Silurian time. New results reported herein yield paleopoles in northern and central Africa for Ordovician to lowermost Silurian and Lower to Middle Devonian formations. The best determined paleopole of our study is for the Early Ordovician Graafwater Formation and falls at 28N, 14E. The other paleopoles are not based on sufficient numbers of samples, but can help to constrain the apparent polar wander path for Gondwana. The results give only paleopoles well to the north of South Africa and no directions within the proposed loop are observed. Hence, if the loop is real, it must have been of relatively short duration (60-70 Ma) and be essentially of Silurian/Early Devonian age, implying very high drift velocities for Gondwana (with respect to the pole) during that interval. (Auth.)

Navarro, F., **Suitability of the South Pole for observation of long-period motions of the Earth** [Idoneidad del Polo sur para el estudio de los movimientos de la tierra de largo período], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.160-171, 12 refs., In Spanish with English summary.

The South Pole provides an unusually good geographic location from which to investigate several important geophysical problems. Its axial location removes a large part of the effects of rotation and ellipticity on the free oscillations of the Earth. It lies on great circle paths which coincide with portions of the oceanic ridges and thus presents an excellent opportunity to study phase velocities sensitive to mantle structure under them. The axial position of the South Pole and the long distance to the oceans make it an ideal place to study long-period tides. (Auth.)

Yuen, D.A., Gasperini, P., Sabadini, R., Boschi, E., **Azimuthal dependence in the gravity field induced by recent and past cryospheric forcings,** *Geophysical research letters,* Aug. 1987 14(8), p.812-815, 14 refs.

Present-day glacial activities and the current variability of the antarctic ice volume can cause variations in the long-wavelength gravity field as a consequence of transient viscoelastic responses in the mantle. The azimuthal dependence of the secular variations of the

gravitational potential is studied. It is found that the non-axisymmetric contributions are more important for recent glacial retreats than for Pleistocene deglaciation. Changes in land-based ice covering Antarctica can be detected by monitoring satellite orbits and their sensitivity to variations in gravitational harmonic for degree *l* greater than 3. Resonances in satellite orbits may be useful for detecting these azimuthally-dependent gravity signals. (Auth.)

Sabadini, R., Smith, B.K., Yuen, D.A., **Consequences of experimental transient rheology,** *Geophysical research letters,* Aug. 1987 14(8), p.816-819, 15 refs.

Recent analyses of transient creep data for lower crustal and upper mantle substances show that the parameters of the Burgers' body rheological model, used up to now by geodynamicists, have much lower ratios of the short-term to long-term viscosities than the laboratory values. These data are used to constrain the viscosity contrast across a 670 km discontinuity. Results show that the previously inferred viscosity variations are now reduced by about a factor of ten in the new transient models. This finding is in agreement with the revised viscosity estimate based on long-wavelength geoid anomalies and seismic tomography. It is shown that time-dependent perturbations to the gravity field from recent ice movements in Antarctica are not at all small. (Auth.)

Gupta, H.K., Varma, A.K., **Magnetic characteristics in Antarctica over geological contacts in Schirmacher Hill region and the ice shelf near Dakshin Gangotri (70 deg 05' 37"S, 12 deg 00' 00"E),** *India. Department of Ocean Development. Technical publication,* 1986 No.3, p.231-239, 10 refs.

Total intensity measurements of earth's magnetic field were carried out in the Schirmacher Hills region and on the ice shelf in the vicinity of Dakshin Gangotri Station using a pair of proton precession magnetometers. Three magnetic traverses totalling about 3 line km, with an average station interval of 7 m and 6 short criss-crossing magnetic profiles totalling over 2 line km in the Schirmacher Hills region were found suitable for further processing. Geological contacts between garnet biotite gneiss and sulphide bearing banded gneiss are associated with sharp magnetic anomalies of the order of several hundred nT. The criss-cross magnetic profiles in the augen gneiss terrain permitted contouring magnetic anomalies at 100 nT interval. Quantitative interpretation of 5 anomalies has been carried out using conjugate points and symmetrical curve procedures, and geometric parameters of possible causative bodies are estimated. Sabadini, R., Yuen, D.A., Gasperini, P., **Mantle rheology and satellite signatures from present-day glacial forcings,** *Journal of geophysical research,* Jan. 10, 1988 93(B1), p.437-447, 55 refs.

By means of transient viscoelastic modeling it has been demonstrated that the longwavelength components of the Earth's gravitational field are sensitive to current glacial discharges and also to the growth of the antarctic ice sheet occurring today. In the model, corrections to the gravitational harmonic coefficient (GHC) value currently attributed solely to the Pleistocene deglaciation may be as large as 30%, depending on the magnitude of growth of the antarctic ice sheet. These effects would cause some uncertainties, no more than a factor of two or three, in the lower mantle viscosities extracted from the GHC data for the lower branch solutions. Although there are uncertainties in current glacial melting estimates, the contamination of the inverted viscosity would be linearly proportional to the uncertainties in the input parameters, for errors in the small amplitude regime, 0(10%). Larger uncertainties would require detailed sensitivity analysis for assessing the impact on the inferred viscosity solutions. These results for the higher zonal harmonics reveal that Antarctica's mass balance may conceivably play an important role. (Auth. mod.)

Le Roex, A.P., **Crust-mantle evaluation in the vicinity of the Bouvet triple junction—a synthesis,** *South African journal of antarctic research,* 1987 17(2), p.90-104, With Afrikaans summary. 36 refs.

Detailed petrologic and geochemical studies of lavas from the vicinity of the Bouvet triple junction indicate that the lavas show a wide range in compositional differentiation extending from Mg-rich picrite basalts to Fe-Ti rich ferrobasalts. Furthermore, in addition to normal geochemically 'depleted' mid-ocean ridge basalt *(MORB),* geochemically 'enriched' *MORB* occurs in abundance throughout the region but is absent to the east of 15E. Tectonic location exerts an important control on the degree of low pressure fractional crystallization experienced by the lavas prior to eruption, but has little effect on degree of geochemical 'enrichment' or source region composition. An integrated model is proposed whereby the mantle source region of 'enriched' lavas from the Southwest Indian and American-Antarctic ridges is invaded by low volume partial melts related to the upwelling Bouvet mantle plume. The mantle source region of 'enriched' *MORB* from the southern Mid-Atlantic ridge has been enriched by a similar process but related to the upwelling of the geochemically distinct 'Shona' mantle plume. Kaminuma, K., Akamatsu, J., **Local earthquakes around Syowa Station, Antarctica,** *Antarctic record,* Nov. 1987 31(3), p.177-185, In Japanese with English summary. 18 refs.

There were no earthquakes located in the antarctic continent before the International Geophysical Year (IGY) in 1957. About ten seismic stations have been operated on the antarctic continent since IGY. Four earthquakes were reported in and around the antarctic continent since 1968. One of the four earthquakes which occurred in 1980 was located in Queen Maud Land in the east antarctic shield area. The occurrence of small and microearthquakes around each seismic station has been reported. However, no earthquake locations were determined because the earthquakes were recorded at only one or two seismic stations. A tripartite seismic network of radiotelemetry was established at Showa Station in 1987. Some tectonic earthquakes were recorded by the network. The magnitude of the earthquakes is less than 3, and P-S is about 20 s. The earthquakes are estimated to be located at about 160 km northeast of Showa Station. (Auth.)

Driscoll, M.L., Parsons, B., **Cooling of the oceanic lithosphere—evidence from geoid anomalies across the Udintsev and Eltanin fracture zones,** *Earth and planetary science letters,* May 1988 88(3/4), p.289-307, 22 refs.

Combined measurements from fracture zones in the South Pacific are not consistent with either the plate model or boundary layer model of cooling. To examine this inconsistency geoid offsets on Seasat profiles were measured across the Udintsev and Eltanin fracture zones in the South Pacific and the robustness of the measurement technique was tested. A second-order polynomial that included a step function centered on the fracture zone was used to estimate the regional geoid and the geoid offset. Using exclusion widths of between 150 and 200 km on most profiles, geoid slope versus average age plots were constructed for each of the limbs of the two fracture zones. Similar trends were found on both the east and west limbs of the Eltanin and the east limb of the Udintsev. The trends were inconsistent with a single thermal plate thickness and instead showed an initial decrease in slope between 0 and 35 m.y., followed by an abrupt increase followed again by a decrease in slope. In contrast, the west branch of the Udintsev shows an increase in geoid slope values between 20 and 35 m.y., followed by a decrease. The fracture zones being studied are components of the Pacific-Antarctic Rise between appr. 50-65S. (Auth. mod.)

Barceló, J.J., III, **International legal regime for Antarctica,** *Cornell international law journal,* Summer 1986 19(2), p.155-161, 20 refs.

DLC JX1.C63

This article serves as an introduction to a symposium on the international legal regime for Antarctica held at Cornell Law School in Oct. 1985. It examines the potential for conflict over the establishment of a mineral regime between the nations that have governed Antarctica under the 1959 Antarctic Treaty and non-treaty nations, and among states with overlapping territorial claims.

M-34881
Francioni, F., **Legal aspects of mineral exploitation in Antarctica,** *Cornell international law journal,* Summer 1986 19(2), p.163-188, 84 refs.

The lawfulness of mineral exploration and development in Antarctica is examined under the Antarctic Treaty and under customary international law. Substantive aspects of the proposed mineral regime and the mineral regime as an institution are discussed with the conclusion that, in order to capture the true essence of the common heritage spirit, antarctic resources must not be allocated according to "first come, first served" rule.

M-34882
Simma, B., **Antarctic Treaty as a treaty providing for an "objective regime",** *Cornell international law journal,* Summer 1986 19(2), p.189-209, 92 refs.

The analysis in this paper develops in two steps: three theoretical approaches, that have been suggested to account for valid and binding effects of objective treaty regimes, are specified in the first step; in the second, considerations are put forward on the position of the Third World states toward a future regime on antarctic mineral resources worked out by the signatories of the Antarctic Treaty.

M-34883
Oxman, B.H., **Antarctica and the new Law of the Sea,** *Cornell international law journal,* Summer 1986 19(2), p.211-247, 125 refs.

The viability of the Antarctic Treaty System is considered in relation to existing international law and the Law of the Sea. The emphasis is on legal and political aspects, but discussions include environmental and economic concerns. It is concluded that the right of access to antarctic minerals is likely to be far less certain and less free of foreign political control under an antarctic arrangement of the kind now being discussed than it is under the deep seabed mining provisions of the Law of the Sea Convention.

Conforti, B., **Territorial claims in Antarctica: a modern view to deal with an old problem,** *Cornell international law journal,* Summer 1986 19(2), p.249-258, 23 refs.

Modern principles are formulated illustrating the course that should be taken in analyzing territorial claims in Antarctica. These theories suggest that the claimant states do not enjoy any rights superior to those enjoyed by the other states carrying out activities in Antarctica. It is suggested that this privilege is granted by the Antarctic Treaty in Article IX, paragraph 2.

M-34886
Hayashi, M., **Antarctica question in the United Nations,** *Cornell international law journal,* Summer 1986 19(2), p.275-290, 94 refs.

The United Nations debate on Antarctica in 1983 and 1984 is described. It includes the Malaysian initiative to present the question to the United Nations, the discussions in the 38th and 39th sessions, and the principal issues raised in the debate. The latter cover territorial claims of sovereignty, adequacy of the Treaty regime, and the proposed international management of Antarctica consisting of five points described as practical measures deserving priority of attention.

M-34887
Colson, D.A., **United States position on Antarctica,** *Cornell international law journal,* Summer 1986 19(2), p.291-300, 13 refs.

This discussion of the United States position on Antarctica covers American political and security interests as well as environmental, scientific, and resource interests. The continuity and consistency of the United States position over many years is illustrated by quotes from a diplomatic note of May 2, 1958, and a speech by President Eisenhower on the subject. Two major challenges to this position are identified: the growing, general, interest in antarctic mineral resources, and the United Nations involvement in this matter.

M-35116
Gardam, J.G., **Management regimes for antarctic marine living resources—an Australian perspective,** *Melbourne University law review,* Dec. 1985 15(2), p.279-312, Numerous refs.

Measures which have been taken to regulate the exploitation of the living resources of the Antarctic region are examined. Initially, this involves a discussion of the legal framework in relation to the Antarctic, namely the Antarctic Treaty of 1959. Then follows an analysis of the conservation measures adopted and the Australian response thereto, with respect to whaling, the fauna and flora of the area and sealing. A brief history of the negotiations leading up to the Convention for the Conservation of Antarctic Marine Living Resources introduces a critical examination of the regime established by the Convention, in particular its structure, the area and scope of the Convention, its objectives and its enforcement and operation. DLC JX4084.A5A97 1986

The Antarctic Treaty entered into force on 23 June 1961, so a review conference could be held, if requested by a Contracting Party, any time after 23 June 1991. It is in anticipation of such a conference that a great deal of lobbying has been going on in order to bring changes to some of the Treaty's terms, widen its membership, publicize its activities. The specific point at issue, sometimes at the forefront of the discussion and sometimes latent, is the possibility of there being exploitable mineral resources on the continent. The purpose

of the conference whose papers constitute this volume was to examine some of these questions, especially from a British and an Australian perspective, and specifically to see whether there is a reasoned basis to the current degree of political interest in Antarctica, whether nationalistic or internationalist pressures are likely to predominate in the coming years both over resource exploitation and scientific cooperation, and whether those who use Antarctica are acting to protect its unique natural environment. (Auth.)

Davis, B.W., **Background to the present situation,** Australia, Britain and Antarctica, edited by T.B. Millar, London, Australian Studies Centre, University of London, 1986, p.4-18, Numerous refs.

DLC JX4084.A5A97 1986

In setting the stage for understanding the present antarctic situation, a brief background to the Antarctic Treaty is provided and four key concepts which have provided stability are discussed. The current rising interest in Antarctica is noted and ambiguities in the Treaty are viewed as a possible Achilles heel which could cause the Treaty to fail. Opposing viewpoints are defined with positions bringing about divisions within and between nations. Several of the emerging issues which are straining the Treaty are briefly discussed: utilization of the renewable and non-renewable resources; territorial rivalries, the antarctic decision-making process; private expeditions and tourism; sanctions against South Africa; and suggested international regimes. Summaries of the arguments pro and con internationalization of Antarctica are presented.

DLC JX4084.A5A97 1986

Antarctica has a direct bearing upon Australia's national security interests, its climate, ocean currents and environment. At the same time, Antarctica offers unique opportunities for scientific endeavour and possibly for economic benefits in the future. These concepts are expounded; global benefits derived from the operation of the Antarctic Treaty are examined. Alterations of viewpoints promulgated from within the Treaty System have served to strengthen the Treaty and provide a wider range of accommodation for those nations whose antarctic experience is limited. In doing these things the Treaty nations refute the arguments of those who would nullify the Treaty and place Antarctica under the aegis of the United Nations.

M-35148

Watts, A.D., **A British perspective,** Australia, Britain and Antarctica, edited by T.B. Millar, London, Australian Studies Centre, University of London, 1986, p.51-59.

DLC JX4084.A5A97 1986

Britain has four primary interests in Antarctica: sovereignty for British antarctic territory; maintenance of peace; development of science and protection for the environment; and economic benefits from resources that may be found. These interests are discussed in terms related to provisions of the documentation comprising the Antarctic Treaty System. Negotiations in progress on an antarctic minerals regime are being engaged in in an atmosphere devoid of pressure from outside entrepreneurs who would insist on speedy action. This before-the-fact process is regarded as an act of prudent forethought. Activities in the UN *vis à vis* Antarctica are reviewed and deemed to be based on mistaken beliefs as to possible wealth in Antarctica, the exclusivity of the Antarctic Treaty, and the ruination of Antarctica through commercial exploitation. Britain believes the Treaty has attained in Antarctica global benefits that other treaties have failed to achieve elsewhere.

Beck, P.J., **Political challenges to the Treaty regime,** Australia, Britain and Antarctica, edited by T.B. Millar, London, Australian Studies Centre, University of London, 1986, p.60-79, 41 refs.

DLC JX4084.A5A97 1986

A brief overview in an international context is given of the first 25 years of development and operation of the Antarctic Treaty System. It is pointed out that pre-1961 actual or perceived rivalries in the region have subsided under the Treaty, though they remain unsolved, and the continent has in fact been an area of peace and science. Various international attitudes toward the ATS have emerged, ranging from support and participation through acquiescenece and indifference to strong criticism and demands for a replacement scheme. Since 1982, a bloc of Third World governments, led principally by Malaysia, has been strongly critical of the ATS, pushing three adverse resolutions through the UN General Assembly which resulted in a polarization of views. The debate as it continued among the pros and cons is discussed. An annex provides a précis of the arguments seeking to move the management of Antarctica to the UN. A caveat precedes the annex and says in effect that universal management does not equate with better management.

M-35150

Wilson, R., **Environmental critique of the Antarctic Treaty System,** Australia, Britain and Antarctica, edited by T.B. Millar, London, Australian Studies Centre, University of London, 1986, p.80-92, Numerous refs.

DLC JX4084.A5A97 1986

The ATS is reviewed as to the antarctic environmental protection provided for in the Antarctic Treaty, recommendations of Consultative Parties, and the formal agreements and conventions entered into by the Consultative Parties. In practice, the environment has not fared as well as the written agreements require or the pious words of the CPs would suggest. Numerous instances of environmental damage are cited ranging from poor management of waste materials through roughshod construction practices and disregard of areas of scientific interest to abuse of animals. It is a matter of grave concern that in none of the cited instances was the offending party called to account for violations of the Treaty. There is a great unwillingness among Consultative Parties to criticize each other for wrong doings.

Miller, T.B., **The way ahead,** Australia, Britain and Antarctica, edited by T.B. Millar, London, Australian Studies Centre, University of London, 1986, p.93-98, 2 refs.

DLC JX4084.A5A97 1986

Materials presented and views expressed during the conference are reviewed and summarized. Much of the discussion centered on the strengths and inadequacies of the Antarctic Treaty System. On balance, its strengths seem to outweigh its weaknesses, with the major flaw being the lack of enforcement powers. The Treaty system will work as long as there is a will among the decision makers to ensure that it works. There is a voice urging that Antarctica be placed under the aegis of the United Nations yet there is no guarantee that management by the 150 members of the UN will produce better results than the ATS. In fact, recent history would indicate that UN members together are not capable of managing anything. It seems necessary to strengthen the Treaty with significant enforcement powers before the Treaty *de jure* becomes the Treaty *de facto.*

Joyner, C.C., Lipperman, P.J., **Conflicting jurisdictions in the southern ocean: the case of an antarctic minerals regime,** *Virginia journal of international law,* Fall 1986 27(1), p.1-38, 125 notes and refs.

This article examines the legal questions stemming from the jurisdictional conflict over submarine resources in the Antarctic. To provide some perspective, the opening section describes the legal status of the southern ocean. The next section assesses the specific jurisdictional questions that conflicting minerals regimes would pose for the antarctic continental shelf. Coastal state sovereignty and regulatory authority on the antarctic offshore is evaluated, with special reference to the territorial claims made by various states to portions of the continent. The concluding section seeks to examine the range of possible accommodations available for resolving these jurisdictional questions, and puts forth some recommendations for critical consideration.

M-35204

Myhre, J.D., **Antarctic Treaty System: politics, law, and diplomacy,** Boulder, Westview Press, 1986, 162p., Refs. p.151-157.

The expressed purpose of this study is to examine how and to what extent the Antarctic Treaty, and its supporting agreements and arrangements collectively called the Antarctic Treaty System, overcame the early challenges to their survival, and to look at the present and future challenges the System faces. This includes a review of the legal and political problems arising from some nations' claims to sovereignty in Antarctica, and of the initial efforts to create an international administration for the region; a study in detail of the terms of the Treaty and the rules of procedure for the consultative meetings. Turning to the diplomatic events that molded the Treaty system, the author concentrates on the issues that emerged in the 1960s: conservation, the role of Meetings of Experts, the position of the Scientific Committee on Antarctic Research within the Treaty system, the obligations of acceding states to uphold previous agreements, and the Consultative Powers' failure to establish an Antarctic Secretariat. Finally, the two main challenges to the system's survival—mineral extraction and Third World opposition to the present structure—are reviewed. Two appendixes, one a full text of the Antarctic Treaty and the other of the Beeby Draft, are included.

Beck, P.J., **International politics of Antarctica,** New York, St. Martin's Press, 1986, 332p., Refs. p.320-322.

DLC JX4084.A5 B4

This study is concerned with how Antarctica's role in international politics has developed in the past and might develop in the future. What is offered here is in the nature of a descriptive and interpretative essay designed to examine Antarctica's international political role from the perspectives of the antarctic past, present and future through the adoption of a multi-disciplinary approach on account of the alliance of political, legal, economic, scientific, environmental and other themes characteristic of the continent's affairs. An attempt has been made to assume an international outlook.

M-35236

Beck, P.J., **Britain's antarctic dimension,** *International affairs,* Summer 1983 59(3), p.429-444, Numerous refs.

DLC JX1.I53

Policies of the British government toward the southwest Atlantic and Antarctica are reviewed from the 1920s through the post-1982 Falklands war period. These policies ranged from the intent to claim the entire continent in the early period through a greatly diminished interest in the 1970s and early 1980s, to a reawakening of interest and renewed activities from mid-1982. The increased funding for antarctic research, the revised Shackleton Report of 1982, and the potential of antarctic resources are all discussed and considered as significant indicators of a change in official British attitudes toward the whole southern region. Yet a nagging question remains: is the rejuvenation of British interest in Antarctica a durable future policy or will it revert to the apathy of the pre-1982 period.

Primeras Jornadas Latinoamericanas sobre la Antártida, Rosario, Sep. 1986, **[Proceedings of the] First Latin American Days on Antarctica, Rosario, Argentina, Sep. 1986** [Primeras Jornadas Latinoamericanas sobre la Antártida, Rosario, Republica Argentina, Septiembre 1986], Rosario, Asociación Argentina de Derecho Internacional, 1986, 72p., In Spanish and Portuguese. Refs. passim. For individual papers see M-35400 through M-35403.

This booklet consists mainly of 4 papers presented at a conference, held in Rosario, Argentina, on the issue of the interests of Latin American countries in Antarctica. An introduction and the program precede the presentations. Conclusions are given at the end which include statements regarding the need of an effective Antarctic Treaty System; comments to the effect that the current Antarctic Treaty System has not been considered adequately by the United Nations General Assembly; and recommendations dealing with cooperation among the Latin American Antarctic Treaty consultative parties in the promotion of studies and resources meant to include and involve non-member nations of Latin America in projects concerning the antarctic region.

Molinari, A.E., **Question of Antarctica in the United Nations—Resolution 40/156: Position of Latin American countries** [Cuestión de la Antártida en las Naciones Unidas—Resolución 40/156 * Posición de los países latinoamericanos], Primeras Jornadas Latinoamericanas sobre la Antártida. Rosario, Sep. 1986, Rosario, Asociación Argentina de Derecho Internacional, 1986, p.7-19, In Spanish. 6 refs.

The stated purpose of this article is to analyze Resolution 40/156, approved by the United Nations General Assembly on Dec. 16, 1985, in reference to the question of Antarctica, and to use it as a basis for the study of the position of Latin American countries on that question. The 3 parts considered in the analysis include continuation of antarctic studies begun in 1983; the issue of antarctic natural resources in general, and the future of minerals regime in particular; and the exertion of pressure, in the frame of the antarctic question, on the government of South Africa regarding its apartheid policy. The position of each country on the above 3 points, as reflected in its vote upon the issues, is commented on, and a detailed list of the votes is given.

M-35401

Colacrai de T., M., **Current trends in the antarctic subsystem** [Tendencias actuales en el subsistema antártico], Primeras Jornadas Latinoamericanas sobre la Antártida. Rosario, Sep. 1986, Rosario, Asociación Argentina de Derecho Internacional, 1986, p.21-43, In Spanish. 6 refs.

The article begins with a historical review of the international system in terms of division of power between East and West, and the diffusion of that power with the emergence of the Third World which, in turn, led to a peaceful coexistence between nations. The Antarctic Treaty, considered an outcome of international organization, is then reviewed. The analysis centers on the antarctic subsystem, represented by three groups with fundamentally separate interests in Antarctica: the developed countries, the "Greenpeace" environmentalists, and the underdeveloped countries which, at present, are not included in the Antarctic Treaty. Conflicts between the groups, generated by the issue of exploitation of potential antarctic resources, and the impact these conflicts have on Latin American countries, are discussed.

M-35402

Caubet, C., **Questions about Antarctica: some Brazilian perspectives** [As questões antárticas: algumas perspectivas brasileiras], Primeras Jornadas Latinoamericanas sobre la Antártida. Rosario, Sep. 1986, Rosario, Asociación Argentina de Derecho Internacional, 1986, p.45-53, In Portuguese. 23 refs.

A brief history of Brazil's participation in antarctic affairs is given, including its first and second expeditions in 1982 and 1984, the opening of the Ferraz Station on King George I., and Brazil's joining the Antarctic Treaty Consultative Parties on July 12, 1983. The stated purpose of this presentation is to convey Brazil's official stand on Brazil's right to be involved in the Antarctic and the advantages of such involvement; to reiterate the desirability of the polar partitioning theory in pursuit of a territorial claims settlement among South American countries; and to stress the necessity of mutual cooperation among those countries in support of common interests in the Antarctic. Three provisions are recommended: provision of common funds to promote participation in the development of antarctic mineral resources; participation in joint ventures by various South American countries; and strengthening of the Consultative Commission to increase its power to promote interchange of scientific and technological information within the regime.

M-35403

Rey C., E.J., **Territorial claims in Antarctica and their projection into sea spaces** [Las pretensiones territoriales en la Antártida y su proyección en los espacios marítimos], Primeras Jornadas Latinoamericanas sobre la Antártida. Rosario, Sep. 1986, Rosario, Asociación Argentina de Derecho Internacional, 1986, p.55-69, In Spanish. 31 refs.

The boundaries of antarctic territories claimed by various nations are defined, and the various theories on which they are based are individually described and evaluated according to the principles of international law. The Antarctic Treaty articles which address the sovereignty question, and the related exploitation of antarctic resources, are reviewed. Next, the Laws of the Sea are examined as applied to the "exclusive" and "comprehensive" economical zones, and whether national jurisdictions could be stretched over antarctic waters. The article is written in the form of an essay and, for reasons of impartiality, no conclusions are offered.

M-35435

Pittman, H.T., **Some geopolitical trends in Argentina, Brazil and Chile. New applications of the law of valuable areas** [Algunas tendencias geopolíticas específicas en los países del ABC. Nuevas aplicaciones de la ley de las áreas valiosas], *Revista de ciencia política,* 1981 No.1-2, p.27-70, In Spanish. 38 refs.

DLC JA5.R495

Described and examined are current geopolitical trends of Latin American countries which expand the conflict of overlapping territorial claims in Antarctica to its surrounding oceans. The analysis reveals the intentions of the governments involved to defend, populate and integrate the empty spaces they claim, and to seek new acquisitions in adjacent areas for the exploitation of new resources. The disputes which these intentions create between competing countries, and their possible consequences, are discussed.

M-35436

Child, J., **Geopolitical thought and four conflicts in South America** [Pensamiento geopolítico y cuatro conflictos en Sudamérica], *Revista de ciencia política,* 1981 No.1-2, p.71-104, In Spanish. 46 refs.

DLC JA5.R495

The third of the four South American conflicts discussed in this article concerns the antarctic region and the overlapping claims of different countries over part of the territory. The historic antecedents are reviewed, including past disputes and their settlement between countries involved. It is expected that current tensions between Chile and Argentina, exacerbated by economic considerations regarding potential exploitation of antarctic resources, will affect South American stability for years to come.

DLC G860.A555 1987

Four possible justifications are presented for maintaining scientific research programs in Antarctica: they are the means to defuse conflicts in the southern areas; they are outlets for intellectual curiosity; they have future value as applied research such as BIOMASS, CCAMLR, and CCAS; they are contributions toward understanding global/geospace effects of man-induced environmental changes. With the advent of antarctic mineral resources negotiations in 1977, the number of nations acceding to the Antarctic Treaty and Consultative Parties began to rise. By 1985 the numbers had increased from 12 to 32 and from 12 to 18 respectively. Additionally, UN members have begun to take a lively interest in Antarctica as have several non-governmental, conservation groups. All of these actions have de-stabilized an area which for twenty-five years has been the very epitome of stability under the banner of scientific research.

M-35727

Heap, J.A., **Antarctic Treaty System: environmental protection, conservation, and the question of competing use,** *Environment international,* 1987 13(1), p.15-18.

The Antarctic Treaty System consists of the Treaty itself, over 130 recommendations made under it, the Agreed Measures for the Conservation of Antarctic Fauna and Flora, the Convention for the Conservation of Antarctic Seals, and the Convention for the Conservation of Antarctic Marine Living Resources. Consultations have been held among parties to the Antarctic Treaty to elaborate an antarctic minerals regime. It has become clear that how to deal with issues of competing use has begun to emerge as an important political question. In such a context the development of an antarctic conservation strategy is a potentially helpful step. Competition of use, when it occurs, will be localized and different in different areas. In only tiny parts will it be severe, but these parts may be the biologically richest coastal areas. Various activities and their possible interactions are considered. It is concluded that any arrangement of antarctic activities which gives an automatic priority of one over others is wrong. Similarly, no activity should be subservient to all others. An antarctic conservation strategy needs to be developed and in its operation the concept of adaptive environmental assessment and management needs to be applied. Within the Antarctic Treaty System there are moves towards assessment. What is needed now is a framework within which such concepts can operate; that is, a conservation and environmental strategy. (Auth.)

M-35864
Joyner, C.C., Theis, E.R., **United States and Antarctica: rethinking the interplay of law and interests,** *Cornell international law journal,* Winter 1987 20(1), p.65-102, Numerous notes and refs.

The major purpose of this study is to evaluate whether the U.S. national interest—defined in terms of its legal, political, economic, and security dimensions—is best served by preserving the current antarctic regime. An additional concern is to sharpen the parameters of the debate on the relevance of international law as a factor in world politics. To accomplish these ends, this study is organized into 4 parts. Part I introduces antarctic issues that allow for a more thorough understanding of the themes elaborated on in the following sections. Part II examines the legal, political, economic, and security (i.e., strategic) values of the current regime for promoting U.S. interests. Part III surveys major elements of the "common heritage" concept. Part IV assesses whether restructuring the antarctic regime according to "common heritage" principles enhances or militates against the U.S. national interests. It is suggested that the best way to protect U.S. interests in Antarctica is to ensure that the 1959 Treaty framework is sustained. In order to respond to the proponents of the "common heritage" concept, the United States must articulate a coherent position in advance. Recognition of this need for a prompt response compels a cogent reevaluation of U.S. antarctic policy.

M-35953
Child, J., **Antarctica and Argentine geopolitical thinking,** Conference of Latin Americanist Geographers. Proceedings. Yearbook, Vol.12, edited by D.L. Clawson, Baton Rouge, Louisiana State University, 1986, p.12-16, 22 refs.

This study suggests that geopolitical thinking in Argentina, as well as in neighboring countries, has strongly influenced Argentine behavior toward Antarctica. Argentine geopolitical thinking has a highly nationalistic tone that views several other states with antarctic interests as potential antagonists. The analysis presented here runs counter to the prevailing optimistic thinking on antarctic issues, which stresses the success of the Antarctic Treaty regime and the cooperation that has characterized much of the exploration and scientific study of that continent. As we approach the critical year of 1991 when the Antarctic Treaty is open for review, we must realistically consider a less optimistic perspective, which, while not ignoring past successes, recognizes existing strains and potential conflicts. M-36016
Beck, P.J., **Cold war: Britain, Argentina and Antarctica,** *History today,* June 1987 37(6), p.16-23, Refs. p.23.

Rivalry for the same part of antarctic territory has proved an important influence upon Anglo-Argentine relations during the present century; in turn, this relationship has constituted a central feature of the international politics of Antarctica. Key antarctic episodes in the development of Anglo-Argentine relations are examined with the help of archival source material, such as the events surrounding Operation Tabarin (1943-45) and the Hope Bay incident (1952). The Antarctic Treaty of 1959 has served to contain and moderate, rather than to resolve, Anglo-Argentine sovereignty rivalries, and the past quarter of a century or so has been characterized by both cooperative and confrontational tendencies. DLC JX4084.A5 A556 1987

The papers in this volume were written for an international conference held in London, Apr. 11-12, 1985. The conference, entitled 'Whither Antarctica?', was organized by the British Institute of International and Comparative Law. This work is intended to build upon the 1982 publication *Antarctic resources policy: scientific, legal and political issue,* edited by F. Orrego-Vicuña (see 13A-28807 or 38-690) by updating the legal, resources and environmental issues presently under consideration within the Antarctic Treaty system and, more recently, by the Secretary-General of the United Nations. An objective of this collection has been to provide a guide to the papers by including an introduction to each part which incorporates points made during conference discussion. Part I treats the physical environment and scientific research; Part II, legal issues; Part III, protecting the marine environment; Part IV, minerals regulation; and Part V, future policies. (Auth. mod.)

Trolle-Anderson, R., **Antarctic Scene: legal and political facts,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.57-64.

DLC JX4084.A5 A556 1987

Negotiations leading to the Antarctic Treaty in 1959 are described. The Treaty's salient features are explained, most particularly the 'ingenious formula' of Article IV, which preserves the legal positions of the Treaty Parties on the question of territorial sovereignty. The practice of consensus in Consultative Party meetings, the 'legislative' procedure of Recommendations and the separate negotiations of inter-linked Conventions are set forth. In response to criticism that the Consultative Parties form a secretive club of states, the cooperative and evolutionary nature of the Antarctic system is stressed as a viable system impossible to recreate in today's political climate. (Auth.)

Orrego Vicuña, F., **Antarctic Treaty system: a viable alternative for the regulation of resource-oriented activities,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.65-76, 27 refs.

DLC JX4084.A5 A556 1987

The author considers the Antarctic Treaty system to be the only viable alternative to regimes based on claims to territorial sovereignty or opposing assertions of universal management. The advantages of regulation through the Antarctic Treaty system are emphasized in contrast with wider international participation; criticisms of the system are rejected including those concerning the decision-making processes and lack of access to information. The question of the right of the Consultative Parties to regulate activities in Antarctica is met with a further question: on what basis does the international community, through the United Nations General Assembly, assert a superior right? (Auth.)

M-36140
Fox, H., **Relevance of Antarctica to the lawyer,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.77-87, 12 refs.

DLC JX4084.A5 A556 1987

The question is posed as to what contributions, if any, a lawyer can make to antarctic regulation. Four stages are suggested at which legal skills have value. The first concerns the validity of claims to territorial sovereignty which are advanced in accord with classical theories of acquisition. The second concerns the negotiation of techniques to accommodate the diverse legal interests of claimant, non-claimant and non-recognizing States. The third relates to development of the legislative processes of regulation through the Antarctic

Treaty system. The fourth, and most intellectually challenging, stage involves the fashioning of new concepts of territorial jurisdiction to resolve or diffuse these conflicting demands. Attention is drawn to the interests which should be considered by an international lawyer when assessing models for Antarctic resource management, including commercial, conservation, recreational and strategic interests which remain outside the ambit of current Antarctic regulatory processes. (Auth.)

Triggs, G.D., **Antarctic Treaty System: some jurisdictional problems,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.88-109, Numerous refs.

DLC JX4084.A5 A556 1987

This paper takes up some legal questions, most particularly those jurisdictional problems which owe their origin to the fundamental conflict between states over territorial sovereignty. These are first, jurisdictional ambiguities which arise form the relationship between the 1982 Convention on the Law of the Sea and the Antarctic Treaty system; second, the criticisms of limited access to decision-making within the antarctic regime; and third, the legal implications for Antarctica of the concept of a common heritage of mankind. This last aspect provides a legal background to a subsequent discussion describing a Third World approach to the concept of a common heritage. (Auth.)

Gulland, J.A., **Antarctic Treaty system as a resource management mechanism,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.116-127.

DLC JX4084.A5 A556 1987

The interlinked food chains and life cycles of antarctic marine species within the Antarctic Convergence are outlined. Some of the lessons which have been learned in past attempts to conserve and manage marine resources, particularly by the International Whaling Commission are described. The influence which the Antarctic Treaty has had upon the structure of the Conventions on Sealing and Antarctic Marine Living Resources is traced and a concession is made that measures adopted under CCAMLR to conserve Antarctic fisheries may appear 'cosmetic'. The position is taken that, imperfect though regulation may be under the Antarctic Treaty system, it remains the preferable alternative to universalisation. (Auth.)

M-36143

Holdgate, M.W., **Regulated development and conservation of antarctic resources,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.128-142, 15 refs.

DLC JX4084.A5 A556 1987

The thesis is developed that the exploitation of living resources must be regulated. Failure to control antarctic fishing in the past is documented, a failure which derived from unregulated exploitation of a common property of 'open-access' resource. Existing environmental regulation in Antarctica is described as establishing both general principles of conservation and use, and specific legislative process for recommendations and measures in certain areas of human impact. It is concluded that the Antarctic Treaty system has evolved methods of environmental conservation which, at the same time, facilitate scientific research. Defects in the system of environmental protection are listed, but it is believed that these defects can be resolved by change within the system itself. (Auth.)

M-36144

Bonner, W.N., **Recent developments in antarctic conservation,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.143-149.

DLC JX4084.A5 A556 1987

A history is provided of Antarctic Treaty Parties' attempts to regulate the environment and the present negotiations between the Scientific Committee on Antarctic Research and the International Union for the Conservation of Nature (IUCN) on World Conservation Strategy are described. The dramatic point is made that the Antarctic is already, by far, the largest natural reserve in the world. (Auth.)

Triggs, G.D., **Negotiation of a minerals regime,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.182-195.

DLC JX4084.A5 A556 1987

Under consideration in this paper is a negotiating draft for a minerals regime. While this draft does not represent a final document, it does suggest the kinds of mechanisms which are under consideration for resolution of conflicting interests concerning sovereignty, conservation of the environment and third world access to resources. (Auth.)

M-36149

Heap, J.A., **Current and future problems arising from activities in the Antarctic,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.201-210.

DLC JX4084.A5 A556 1987

The question of future problems within the Antarctic Treaty system is considered, in the light of the preambular objective of the Antarctic Treaty that Antarctica should not become the 'scene or object of international discord'. It is argued that fears that the Antarctic Treaty Parties will be unable to deal with allegations of infringements of Treaty obligations (for example, of French plans to build an airstrip at Pointe Geologie) raise further doubts whether Parties can properly deal with prima-facie infringements of rules established within a future minerals regime. However, a more rigorous inspection system and the development of the political will to favor long-term interests above short-term advantages can overcome these problems. The paper considers the specific difficulties raised by fishing, minerals exploitation and decision-making (which rests upon the lowest common denominator) and claims to territorial sovereignty. It is concluded that effective management of resources and the environment can be achieved if states assert their claims to territorial jurisdiction rather than through any form of internationalization. (Auth.)

M-36150

Zain-Azraai, D., **Antarctica: the claims of 'expertise' versus 'interest',** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.211-217.

DLC JX4084.A5 A556 1987

It is argued that Antarctica is, or should become, the common heritage of mankind. The paper criticizes the assumption that a right to regulate antarctic resources can be founded on prior experience. Rather, the justifiable interests of the international community in antarctic management provide an appropriate basis for assuming a right to regulate resource exploitation in Antarctica in the future. It is recommended that a United Nations Ad Hoc Committee be formed to consider future regulation of antarctic resources on the ground that to do so provides the best chance of reconciling all legitimate interests. (Auth.)

M-36151
Rowland, J.R., **Whither Antarctica? Alternative strategies,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.218-226.

DLC JX4084.A5 A556 1987

The opposing views of the two preceding papers (M-36149 and M-36150) are examined in this paper which assesses alternative strategies for antarctic regulation. Proposed reforms within the Treaty system itself are considered along with more radical suggestions for a United Nations Trusteeship for a new international regime negotiated under the auspices of the United Nations and which has a genuinely universal character, and for separate regulation of minerals exploitation by a new international body representing all special interests. It is observed that the United Nations General Assembly may well endorse the central articles of the Antarctic Treaty and possibly also Article IV. Nonetheless, risks of instability are posed by negotiations for a minerals regime. The favored action is a moratorium on exploitation and the declaration of Antarctica as a world conservation area subject to United Nations endorsement. This, it is believed, is a practical means of avoiding conflicts between advocates of a common heritage, conservationists, and Antarctic Treaty Parties. (Auth.)

M-36152
Triggs, G.D., **United Nations in Antarctica? A watching brief,** Antarctic Treaty regime: law, environment and resources, edited by G.D. Triggs, Cambridge, Cambridge University Press, 1987, p.229-233.

DLC JX4084.A5 A556 1987

A summary is presented of the legal, environmental and political issues confronting the Antarctic Treaty parties, and those aspects of the Antarctic Treaty regime which require change or modification are identified. A summary is also given of the views of non-Treaty states which were submitted to the Secretary-General and included in his report to the United Nations in 1984. Consideration is given to the procedural options open to the General Assembly when it reviews the 'Question of Antarctica' on the agenda in 1986. While it seems unlikely that any Antarctic committee will be established under the auspices of the United Nations, the General Assembly may adopt a 'watching brief' over activities within the Antarctic Treaty regime by retaining the issue on the agenda. (Auth.)

Schmied, J., **Antarctica in the international system: challenges of the 1990s** [La Antártida en el sistema internacional: Los desafíos de la década del 1990], Actas del segundo Symposium Español de Estudios Antárticos. (Spanish Symposium on Antarctic Studies, 2nd, Madrid, July 13-15, 1987. Proceedings.) Edited by J. Castellví, Madrid, Consejo Superior de Investigaciones Científicas, 1987, p.239-250, In Spanish with English summary.

After a short description of the Antarctic Treaty, the following is discussed: the debate between the supporters of the common-heritage-of-all-mankind formula in relation to the legal status of the antarctic continent and the members of the Antarctic Treaty; the problems that could arise from the legal status of Antarctica in relation to the type of organization, vote procedures and financial participation if the common-heritage-of-all-mankind formula were adopted; and the problems that the future exploitation of antarctic mineral resources will pose for both members and non-members, of the Antarctic Treaty. (Auth.)

M-36395
Mericq, L.S., **Antarctica: Chile's claim,** Washington, D.C., National Defense University Press, 1987, 125p.

The history of major antarctic explorations and discoveries is reviewed, and the diverse physical characteristics of the continent are described. The pressures, environmental and political, that threaten the future development of Antarctica are analyzed, and a critical examination of the Antarctic Treaty, with its full text appended, is presented. In conclusion, a case is made for antarctic claims of Chile, with a description of the geographical aspects of the Chilean Antarctic Territory, historical and juridical data on Chile's interests in Antarctica, Chile's presence in Antarctica, and a number of supporting figures, maps, photographs, tables and illustrations.

Ramacciotti de Cubas, B., **Peru and the antarctic question** [El Perú y la cuestión Antártica], Lima, Centro Peruano de Estudios Internacionales, 1986, 76p., In Spanish. Refs. p.74-76.

After a brief review of antarctic geography, the economic and strategic value of the antarctic continent to the international community, the various bases for jurisdiction asserted by nations claiming sovereignty in Antarctica, the position of non-claimant countries, the Antarctic Treaty System, and the growing complexities of the antarctic issues in an international context, the focus is shifted to the principal factors to be considered for an adequate protection of Peruvian interests in Antarctica. This includes a discussion of the official position and scientific activities involving Peru with Antarctica between 1979 and 1983, an analysis of the 3 currents of thought regarding the type of involvement Peru should exercise in the future, and recommendations that Peru adopt an antarctic policy based on the changes occurring in the international scene currently and in the crucial next 5 years.

M-36482
Child, J., **Antarctica: issues and options,** *Marine policy reports,* Sep. 1987 10(1), p.1-5.

After a review of antarctic geography and history, the validity of national claims to Antarctica by various nations, the Antarctic Treaty, and the Antarctic Treaty System (ATS), an analysis is made of the issues that pose a threat to the survival of the latter. These include: the sovereignty issue, the antarctic resource exploitation, the environmental issues, the strategic and geopolitical issues, and the issue of 1991. Various options and approaches—retaining the *status quo,* expanding the ATS, internationalization, world park—are examined, with a discussion of the controversial Quadrant Condominiums theory and the concept of South American Antarctica for the Latin Americans. It is concluded that the most likely rational prospect for Antarctica is the one in which an expanded ATS undercuts the Third World internationalizing thrust and establishes an effective minerals regime, with environmental safeguards, as protection against the political and ecological dangers associated with a major find of an exploitable resource.

M-36489
Beck, P.J., **United Nations and Antarctica,** *Polar record,* Sep. 1987 23(147), p.683-690, 19 refs.

In Nov. 1986 the United Nations considered again the 'Question of Antarctica' and published a further study, up-dating and developing that produced in 1984 and guiding UN First Committee discussions of 18-19 Nov. 1986. Three resolutions were adopted concerning availability of information to the UN on Antarctica, a moratorium on the antarctic minerals regime negotiations, and the exclusion of South Africa as a Consulative Party. Most Antarctic Treaty parties did not vote; the consensus that characterized UN debates on Antarctica in 1983 and 1984 has yet to be restored. The 1986 session suggested more questions rather than providing answers; a key question is whether the Antarctic Treaty System will preserve its unity in view of the problem of continuing South African membership. (Auth.)

Lynk, M.A., **Geopolitical implications of antarctic mineral resource development,** *U.S. Air Command and Staff College. Student report,* Apr. 1984 No.84-1625, 70p., 74 refs.

The report presents a current review of open sources on the issue of exploration and speculated exploitation of antarctic mineral resources with analysis of resultant geopolitical considerations. Brief overview of antarctic history, physical characteristics, Treaty evolution and provisions, and marine life exploitation precedes discussion of on and off-shore mineral elements, extraction and environmental constraints. The report concludes with evaluation of Treaty regime's viability versus mineral resource development pressures, including the UN, Third World, and Law of the Sea Treaty, and enumerates concerns for US role in Antarctica. (Auth.)

M-36546
Handbook of the Antarctic Treaty System, Cambridge, Scott Polar Research Institute, Feb. 1987, var. p., Fifth edition.

This handbook reproduces material related to the complex of arrangements comprising the Antarctic Treaty System. The major part of the volume consists of the text of the Antarctic Treaty and the "measures ["Recommendations"] in furtherance of the principles and objectives of the Treaty" adopted at Antarctic Treaty Consultative Meetings (ATCMs) held since 1961, together with relevant extracts from the reports of those meetings. The recommendations and extracts from reports are grouped into sections derived from the list of topics contained in Article IX of the Treaty. Introductory notes precede many of these sections to indicate briefly the scope and intention of the arrangements recorded in each section. A consolidated text of the Agreed Measures for the Conservation of Antarctic Fauna and Flora is included in Section 2. Eleven annexes contain, mainly, the following: a consolidated table showing which of the Recommendations have become effective in accordance with Article IX of the Treaty; a list of spent measures, together with the texts of Recommendations of which account has been taken elsewhere; the text of the Convention for the Conservation of Antarctic Seals, London 1972; the text of the Convention for the Conservation of Antarctic Marine Living Resources, Canberra 1980; material on 3 meetings of experts on Antarctic Telecommunications; and 2 reports (1977 and 1979) on technological and environmental questions related to antarctic minerals.

Vaucher, M.E., **Prospective maritime jurisdictions in the polar seas,** *Woods Hole Oceanographic Institution. Technical report,* Jan. 1983 WHOI-83-1, 1 sheet, 26 refs.

The map illustrates the possible extent of maritime jurisdictional claims in Antarctica assuming application of the provisions of the United Nations Convention on the Law of the Sea. All sector claims to Antarctica were placed in abeyance by the 1959 Antarctic Treaty. Also shown on the map are equidistance maritime boundaries, land political boundaries, negotiated maritime boundaries, 200 N.M. exclusive economic zone, high seas, antarctic ice shelves, and 500 and 2500 m isobath lines. (Auth. mod.)

M-36979
Beck, P.J., **Antarctic minerals regime negotiations,** *Polar record,* Jan. 1988 24(148), p.59-61, 12 refs.

The antarctic minerals regime negotiations have made considerable progress towards the ATCPs' goal of filling a perceived gap in the ATS regarding the management of mineral resource activities and, at the same time, of ensuring that this will be achieved in a responsible and orderly manner through a regime capable of withstanding the test of time. A number of problems, most notably those concerning sovereignty, have had to be, and indeed are still being, resolved through the consensus approach characteristic of the ATS. Further compromises and accommodations are required still, but it is evident that areas of difference have been narrowed and those of consensus increased, thereby enhancing prospects for the conclusion of a Mineral Resources Convention about mid-1988. In such circumstances, the 1986 UN resolution in favor of a moratorium on the minerals negotiations seems unlikely to be heeded, while the demand of environmental groups for a world park appears also to have been overtaken by the momentum of events. In the meantime, the minerals negotiations continue. (Auth.)

M-36993
Joyner, C.C., **Antarctic minerals negotiating process,** *American journal of international law,* Oct. 1987 81(4), p.888-905, 41 refs.

Since 1982, a select group of states has been engaged in a series of multilateral negotiations to fashion a regime governing the exploration and exploitation of minerals in the antarctic region. The chief purpose of this paper is to analyze the process by which this group of concerned states has pursued national priorities within the decision-making framework and context of the antarctic minerals negotiations. Section 2 examines briefly the background to the Antarctic Treaty system; in section 3 the domestic facets of the antarctic minerals negotiating process are described; the thrust of the study is found in section 4, which appraises the international dimension of the antarctic minerals negotiating process; section 5 contains a critique of the negotiations, and section 6 presents some conclusions about their contribution to the international law-making process. (Auth. mod.)

M-37105
Mitchell, B., **Undermining Antarctica,** *Technology review,* Feb./Mar. 1988 91(2), p.48-57.

Following a brief background survey of Antarctica—why it is important that Antarctica be viewed as a part of the world which affects all other parts, how it was discovered, and how it came into public notice—a critique of the Antarctic Treaty system is presented. The Treaty itself and its adjuncts, including the minerals regime agreement, which together make up the ATS are faulted for vagueness in establishing responsibilities and having weak or no enforcement provisions for violations. Science programs are regarded as being bargaining chips in antarctic politics. The point of view reflects a strong desire to protect the antarctic environment and a profound distrust of the ATS and all who participate in, negotiated, and now administer the System. In the case of the minerals regime agreement, an alternative to political controversies is offered in which the agreement would be altered to include strong, detailed regulations to protect the environment and to ease the qualms of nations not belonging to the ATS.

M-37265
Ramacciotti de Cubas, B., **Antarctica as a peace zone** [La Antártida como zona de paz], *Thémis,* 1988 No.10, p.42-45, In Spanish.

Peaceful uses of Antarctica, and its demilitarization and denuclearization in the light of the Antarctic Treaty principles, are discussed, and the Treaty is found to be a valuable mechanism in the international cooperation toward that end. The points establishing the importance of a peaceful Antarctica to Latin America in general, and to Peru in particular, are considered, with the conclusion that adoption of a territorial claim policy, or of the common heritage principle, is not a preferable alternative to the *status quo.*

M-37266
Child, J., **Antarctica and the southern ocean: Latin American interests,** *Third world affairs,* 1988 p.370-381, 37 refs.

The background of recent developments in Antarctica, the surrounding ocean, and the Antarctic Treaty System (ATS) is addressed, with emphasis on the Latin American nations and their maritime interests. This includes the sovereignty problems and claims, the strains on the ATS by the resource question, the time pressures of 1991, the pressure by non-members of the ATS, and the U.N. debates. Also reviewed are the controversial options for a South Atlantic security policy, the South Pacific security and ecological issues, and the question of South Africa's presence in the ATS. The most significant developments over the past years affecting change within the ATS are summarized.

M-37267

Lee, S.-H., **Third World approaches to Antarctica,** *Third world affairs,* 1988 p.382-391, 39 refs.

Some of the key interests that characterize contemporary Third World politics in Antarctica are examined, including the political-legal barriers to newcomers in the Antarctic Treaty regime, and the three major group categories—territorial claimants, *status quo* supporters, and revisionists—reflecting national policies pursued. It is concluded that in spite of these distinct and sometimes contradictory Third World approaches, their views and increasingly vocal claims for an equitable antarctic management system are likely to reshape the political context of the continent in the next decade.

M-37269

Joyner, C.C., **Evolving antarctic minerals regime,** *Ocean development and international law,* 1988 Vol.19, p.73-95, 116 refs. and notes.

The Antarctic Treaty Consultative Parties are completing negotiation on a minerals regime for the continent and its coastal waters. As determined from the most recent treaty text, 4 principal organs will comprise the regime: (1) the Special Meeting of All States, which will allow Non-Consultative Party members some voice in the regime; (2) the Antarctic Minerals Resources Commission, the executive agency for deciding whether or not to open an area in the Antarctic for mineral development; (3) Regulatory Committees for each area, responsible for overseeing any exploration and exploitation activities; and (4) a Scientific, Technical and Environmental Advisory Committee to draft assessments and make recommendations to the Commission on environmental consequences of developmental activities. The success of the antarctic minerals regime will turn on the ability of the ATCPs to accommodate their national interests with the international community and the regime's ability to preserve and protect the antarctic environment.

DLC JX4084.A5 A57

The future of Antarctica is the topic of this three part volume. The first three chapters address the value of the Antarctic Treaty, the argument for changes in it, and how it has an effect on and could better serve non-governmental organizations, conservation, and the environment. The next four chapters outline the current and potential uses the region has in the field of science, resources, conservation, mineralogy, as well as military strategy. Part three speculates on the future and its call for action. Four appendices, maps, references, and an index are included.

M-37383

Law, P., **Future policy for the Antarctic,** *Interdisciplinary science reviews,* Dec. 1985 10(4), p.336-348, 12 refs.

Before suggesting a realistic scientific, commercial and political future policy for the antarctic continent, the author reviews various eras of past antarctic activity. These were the Trading Era, followed by the Imperialistic Era and the Scientific Era, the advent of the IGY and SCAR, and the Antarctic Treaty. Full attention is given to the commercial resources of the Antarctic and their exploitation, which leads logically to the options available for the future. The 'Heritage of Man' concept is favored under supervision by the Treaty Nations. (Auth.)

Zvegintsev, A.I.
Drying krill meat in the developed stage of the boiling layer [1986, rus] **B-35097**
Zwally, H.J.
Antarctic ice-shelf boundaries and elevations from satellite radar altimetry [1987, eng] **C-36080**
Technology in the advancement of glaciology [1987, eng] **F-36968**
Remote sensing as a research tool [1986, eng] **G-35397**
Zwierzykowski, W.
Changes of phospholipid fraction from krill lipids in a cold stored mixture with cod muscle homogenate [1985, eng] **B-34746**
Zykov, I.D.
Vertical structure of the Antarctic Circumpolar Current in the region between Africa and Antarctica [1986, rus] **J-34715**

SUBJECT INDEX

Ablation
See under: Glacier ice; Ice sheet; Icebergs; Shelf ice

Absorption
See under: Ionosphere. *See also:* Cosmic noise absorption; Polar cap absorption

Acclimatization
Hygienic, architectural and psychological aspects of improved living conditions in Antarctica [1987, rus] **A-36949**
Walk to the Pole: to the heart of Antarctica in the footsteps of Scott [1987, eng] **A-36996**
Ecology of *Cryptopygus sverdrupi* from Queen Maud Land [1986, eng] **B-34666**
Antarctic fishes [1986, eng] **B-34703**
Study of sleep in Emperor Penguins [1986, eng] **B-34705**
Liquid ingestion effect on cold tolerance in mites [1986, eng] **B-34743**
Relative humidity related to cold tolerance of an antarctic mite [1986, eng] **B-34872**
Subantarctic freshwater [1983, eng] **B-34876**
Latitudinal variation of fecundity and embryonic development of *Ceratoserolis trilobitoides* [1987, eng] **B-34917**
Renal glomerular evolution in antarctic notothenioid fishes [1986, eng] **B-35033**
Presumptive MAPs and "cold-stable" microtubules from antarctic marine poikilotherms [1986, eng] **B-35070**
Antifreeze activity of antarctic fish glycoprotein and a synthetic polymer [1987, eng] **B-35099**
Adaptive significance of size and pigmentation of an isolated population of the subantarctic dolphin *Cephalorhynchus commersonii* (Lacépède, 1804) [1986, fre] **B-35240**
Cold-stable microtubules from antarctic fish [1985, eng] **B-35374**
Freezing avoidance and the distribution of antifreeze glycopeptides in antarctic fish [1985, eng] **B-35376**
Antifreeze glycoprotein of polar fish [1986, eng] **B-35386**
Antifreeze glycoproteins from polar fish blood [1986, eng] **B-35472**
Ecology of snow algae [1986, eng] **B-35588**
Breeding cycle in Wilson's storm petrels at King George I. [1986, eng] **B-35597**
Brachiopod *Liothyrella uva* oxygen consumption and nitrogen excretion [1986, eng] **B-35623**
Heart metabolism of hemoglobin- and myoglobin-free fish [1987, eng] **B-35718**
Arg-containing antifreeze glycoprotein from fish *Eleginus gracilis* [1986, eng] **B-36019**
Cold tolerance in mites [1987, eng] **B-36113**
Temperature compensation in myotomal muscle of fish [1987, eng] **B-36154**
Cold-hardiness in the antarctic tick, *Ixodes uriae* [1987, eng] **B-36180**
Cold-stable microtubules from antarctic fishes contain unique alpha tubulins [1987, eng] **B-36183**
Signs of adaptation to high altitude in albino rats [1986, rus] **B-36236**
Adaptation to temperature in fish muscle [1986, eng] **B-36239**
Multiple stress tolerance in an antarctic terrestrial arthropod: *Belgica antarctica* [1987, eng] **B-36300**
Physiological and ecological correlates of temporally limited resources in the polar regions [1987, eng] **B-36315**
Antarctic sponges and their peculiarities [1987, spa] **B-36386**
Antifreeze glycopeptides in fish [1987, eng] **B-36512**
Aerobic scope of the fish *Pagothenia borchgrevinki* and adaptation to cold [1987, eng] **B-36620**
Enzyme activity in krill. Immunology [1987, eng] **B-36700**
Antifreeze glycopeptides and peptides: interactions with ice and water [1986, eng] **B-36874**
Respiration of the antarctic fish from McMurdo Sound [1987, eng] **B-36890**
Differential temperature effects on the efficiency of carbon pathways in antarctic marine benthos [1987, eng] **B-36895**
Molecular aspects of adaptation to extreme cold environments [1986, eng] **B-36899**
Antarctic cold desert and the search for traces of life on Mars [1986, eng] **B-36900**
Microbial life at extremely low nutrient level [1986, eng] **B-36901**
Goose barnacle *Lepas australis* in fouling subantarctic waters [1987, eng] **B-37120**
Sea ice microbial communities (SIMCO). 9. Effects of temperature and salinity on rates of metabolism and growth of autotrophs and heterotrophs [1988, eng] **B-37127**
Biomedical aspects of antarctic research [1986, por] **B-37200**
Solute effects on ice recrystallization: an assessment technique [1988, eng] **B-37255**
Growth rates of antarctic marine phytoplankton in the Weddell Sea [1987, eng] **B-37289**
Benthic fauna and biopolymer degrading bacteria [1988, eng] **B-37342**
Ecophysiology of terrestrial arthropods [1987, eng] **B-37356**
Ecophysiology of intertidal mites at South Georgia [1987, eng] **B-37357**
Adaptive strategy of littoral mites from Kerguelen Is. [1987, fre] **B-37358**
Transpiration hysteresis and supercooling capacity in a subantarctic dipteran [1987, fre] **B-37360**
Cold tolerance in subantarctic adult dipteran *Anatalanta aptera* [1987, fre] **B-37361**
Biological effects of natural and artificial antifreezes [1987, eng] **B-37402**
Breeding ecology of *Thalassoica antarctica* in Queen Maud Land [1987, eng] **B-37463**
Progressive endemism in ammonite family Kossmaticeratidae after Gondwanaland breakup [1987, eng] **E-35810**
Health and performance of antarctic winter-over personnel [1986, eng] **H-34908**
Behavioral temperature regulation during a traverse [1986, eng] **H-35015**
Glandular alterations in man after prolonged residence in Antarctica [1986, eng] **H-35017**
Adaptation of cardiovascular system in man to antarctic conditions [1984, rus] **H-35086**
Occupational health among ANARE wintering personnel [1987, eng] **H-35453**
Winter in Antarctica: health despite discomfort [1987, eng] **H-35484**
Adaptation changes of the cardiovascular system in antarctic explorers [1987, rus] **H-36947**
Seasonal dynamics of blood circulation indices of antarctic explorers [1987, rus] **H-36948**
Longitudinal study of disease incidence among antarctic winter-over personnel [1987, eng] **H-36995**
Physiological report [1987, eng] **H-36997**
Adaptation and its prognosis in people with different levels of hypoxic stability at high altitudes of Antarctica [1984, rus] **H-37004**
Proceedings. Circumpolar health 84 [1985, eng] **H-37019**
Acclimatization to cold in antarctic scuba divers [1985, eng] **H-37021**
Dynamics of some blood indexes of wintering-over personnel [1987, rus] **H-37076**
Daily and seasonal variations of vector-electrocardiogram in wintering-over personnel [1987, rus] **H-37077**
First antarctic winter in tents: The Joint Services Expedition to Brabant Island. Pt.1 [1986, eng] **H-37310**
First antarctic winter in tents: The Joint Services Expedition to Brabant Island. Pt.2 [1986, eng] **H-37311**
Joint Services Expedition to Brabant Island, Antarctica: overwintering in tents [1986, eng] **H-37485**

BEHAVIOR

Scavenging and other feeding habits of lysianassid amphipods from McMurdo Sound [1986, eng] **B-34665**
Variations in krill size in small swarms [1986, eng] **B-34795**
Structure and composition of a large krill swarm at Elephant Island [1984, eng] **B-34846**
Krill behavior under sea ice, spring 1985 [1987, eng] **B-36306**
Escape responses of *Euphausia superba* and other euphausiids [1987, eng] **B-36307**
Distribution of *Euphausia crystallorophias* [1987, eng] **B-36693**
Vertical distribution and diurnal migrations of krill—*Euphausia superba* Dana—from hydroacoustical observations, SIBEX, Dec. 1983-Jan. 1984 [1987, eng] **B-36694**
Antarctic krill CPUE related to abundance [1987, eng] **B-37346**

BREEDING CYCLES AND REPRODUCTION

Latitudinal variation of fecundity and embryonic development of *Ceratoserolis trilobitoides* [1987, eng] **B-34917**
Mass species of oceanic phytophagous copepods and their ecology [1986, eng] **B-35462**
Euphausia crystallorophias from Enderby Land and ontogeny of neritic euphausiids [1987, eng] **B-35612**
Biomass and population of krill collected during SIBEX II [1986, eng] **B-35663**
Krill gonad history during breeding season [1987, eng] **B-35719**
Krill population comparisons, 1981 and 1984, near South Shetland Is. [1987, eng] **B-36225**
Biological properties and distribution of krill in East Antarctica [1987, rus] **B-36281**
Lab studies of sexual processes in female antarctic krill [1987, eng] **B-36293**
Laboratory postembryonic development of *Drescheriella glacialis* [1987, eng] **B-36616**
Enzyme polymorphism in antarctic krill *(Euphausia superba);* the phosphoglucomutase locus [1987, eng] **B-36724**
Distribution, abundance and population of krill in Prydz Bay [1988, eng] **B-36821**
Biology of the antarctic euphausiid *Thysanoessa macrura* G.O. Sars from the Atlantic sector of the Antarctic [1987, rus] **B-36945**
Energy sources for recruitment of a subantarctic copepod [1987, eng] **B-37286**
Thelycum and spermatophore structure in *Euphausia superba* and *E. crystallorophias* [1987, eng] **B-37456**

ECOLOGY

Ecology of a meromictic lagoon zooplankton [1986, eng] **B-34745**
Effect of hydrostatic pressure on krill embryo sinking rates [1985, eng] **B-34787**
Hydrological indices for the differentiation of the range of antarctic krill [1986, eng] **B-34888**
Food of the Cape Pigeon from Princess Elizabeth Land [1986, eng] **B-35019**
Mass species of oceanic phytophagous copepods and their ecology [1986, eng] **B-35462**
Oceanographic structure of Scotia Sea and copepod distribution in 1981 [1987, eng] **B-36115**
Drescheriella glacialis n. gen., n. sp. in sea ice [1987, eng] **B-36223**
Euphausiid populations off Elephant I., Mar. 1984 [1987, eng] **B-36226**
Summer phytoplankton in Bransfield Strait [1986, eng] **B-36240**
Goose barnacle *Lepas australis* in fouling subantarctic waters [1987, eng] **B-37120**

EMBRYOLOGY

Effect of hydrostatic pressure on krill embryo sinking rates [1985, eng] **B-34787**
Krill egg development in relation to pressure [1985, eng] **B-34827**
Latitudinal variation of fecundity and embryonic development of *Ceratoserolis trilobitoides* [1987, eng] **B-34917**
Euphausia superba: a preliminary report on three areas of investigation [1985, eng] **B-35373**
Fish parasite *Gnathia calva* Vanhöffen and synonymy with *Heterognathia* Amar & Roman [1987, eng] **B-35611**
Euphausia crystallorophias from Enderby Land and ontogeny of neritic euphausiids [1987, eng] **B-35612**
Mature krill grown from eggs in laboratory [1987, eng] **B-36112**
Female-specific protein in krill [1986, eng] **B-36243**
Vertical distribution of krill larvae in Bransfield Strait, 1982-1983 [1986, eng] **B-36245**
Laboratory postembryonic development of *Drescheriella glacialis* [1987, eng] **B-36616**

EVOLUTION

Karyotypes of two populations of the genus *Tisbe* from Kerguelen Is. [1986, fre] **B-35608**

EXPLOITATION

Mineral and maritime resources of Antarctica [1986, eng] **A-35145**
Krill conventions [1987, swe] **A-37232**
Germany's participation in SIBEX and CCAMLR [1986, eng] **B-34689**
Krill processing for human consumption [1986, eng] **B-34696**
Heat coagulation of centrifuged raw krill mince [1986, eng] **B-34697**
Amino acids in blood serum during digestion of krill protein [1985, rus] **B-34730**
Values of food hydrolysates from fish and krill [1985, rus] **B-34731**
Changes of phospholipid fraction from krill lipids [1985, eng] **B-34746**
Carotenoids in frozen antarctic krill and in some of its semifinished products [1985, eng] **B-34747**
Amino acid changes in canning of shrimp [1986, rus] **B-34825**
Growth and longevity of krill during the first decade of pelagic whaling [1986, eng] **B-34839**
Krill peeling machine [1983, eng] **B-34850**
Chitinase, protease and fluoride concentrations in fish feeding on krill [1986, eng] **B-34862**
Physical and chemical properties of krill chitin [1986, jpn] **B-34928**
Supercritical carbon dioxide extraction of oils from antarctic krill [1986, eng] **B-34937**
Effects of krill as an emulsifier on rabbit metabolism [1986, eng] **B-35048**
Drying krill meat in the developed stage of the boiling layer [1986, rus] **B-35097**
Changes in 5'-inosine monophosphate during sterilization of krill meat [1985, rus] **B-35237**
Manufacture of crab meat-textured protein fiber from antarctic krill [1986, jpn] **B-35238**
Trophic level of *Pleuragramma antarcticum* in Bransfield Strait and other areas of the Antarctic [1986, spa] **B-35279**
Changes of non-protein nitrogens fractions in krill during storage [1986, eng] **B-35290**
Meat quality from hogs fed krill meal [1984, pol] **B-35434**
Fluoride turnover in birds [1987, eng] **B-35619**
Status and conservation of antarctic seals and seabirds: a review [1987, eng] **B-35733**
Conservation of living marine resources [1987, eng] **B-35738**

Arthropoda-Crustacea
EXPLOITATION *(cont.)*
Effect of pigment content in diet on rainbow trout offspring [1986, eng] **B-35755**
Krill freshness evaluation by objective and subjective methods [1987, spa] **B-35890**
Summer phytoplankton in Bransfield Strait [1986, eng] **B-36240**
Discards from commercial fishing of krill found during the *Antártida 8611* cruise [1987, spa] **B-36379**
Distribution of *Euphausia crystallorophias* [1987, eng] **B-36693**
Trophic level of *Pleuragramma antarcticum* in west antarctic waters [1986, eng] **B-36829**
Distribution of seabirds in the Bouvet Island area in winter 1982 [1987, rus] **B-36946**
Pigmentation of juvenile coho salmon with carotenoid oil extracted from antarctic krill [1987, eng] **B-36969**
Studies on the spinnability of antarctic krill muscle proteins treated with alkali [1987, eng] **B-37091**
Spinnability of antarctic krill muscle proteins and the behavior of spinning dope [1987, eng] **B-37092**
Seasonal changes in krill's nitrogen fractions [1987, eng] **B-37171**
Biochemistry of antarctic krill and blue whiting [1987, eng] **B-37194**
Seabird ecology [1987, eng] **B-37198**
Enzymatic activities of psychrotrophic bacteria from antarctic krill [1987, eng] **B-37400**
Geopolitical thought and four conflicts in South America [1981, spa] **M-35436**
GEOGRAPHIC DISTRIBUTION
Polymorphism and distribution of *Ceratoserolis trilobitoides* in Weddell Sea [1986, eng] **B-34661**
Density variations in krill and phytoplankton in antarctic waters [1986, eng] **B-34784**
Species composition and relative abundance of copepods in Chilean fjords [1985, eng] **B-34789**
Pelagic shrimp of the family Oplophoridae from Pacific southern ocean [1986, eng] **B-34798**
Crustacea Tanaidacea of the Antarctic and the Subantarctic [1986, eng] **B-34823**
Structure and composition of a large krill swarm at Elephant Island [1984, eng] **B-34846**
Hydrological indices for the differentiation of the range of antarctic krill [1986, eng] **B-34888**
Revision of the genus *Batheuchaeta* (Calanoida, Aetideidae) [1986, rus] **B-35125**
Biology and distribution of *Pasiphaea* species in the antarctic ocean [1987, eng] **B-35315**
Mass species of oceanic phytophagous copepods and their ecology [1986, eng] **B-35462**
Krill population in Drake Passage and Bransfield Strait, Dec. 1983-Jan. 1984 [1986, eng] **B-35599**
Krill fluoride content in relation to size and regional origin [1986, eng] **B-35601**
Biogeographical grouping by dendrite analysis [1986, eng] **B-35604**
Biomass and population of krill collected during SIBEX II [1986, eng] **B-35663**
Macroplankton zoogeography and community analysis [1987, ger] **B-35851**
Distribution of meso- and macrozooplankton in Weddell Sea surface water [1987, ger] **B-35856**
Two sibling species of the *Tigriopus angulatus* group from Crozet and Kerguelen Is. [1987, fre] **B-36108**
Oceanographic structure of Scotia Sea and copepod distribution in 1981 [1987, eng] **B-36115**
Krill population comparisons, 1981 and 1984, near South Shetland Is. [1987, eng] **B-36225**
Distribution and biogeography of crustacean decapods in antarctic waters [1987, spa] **B-36380**
Paleobiogeography of two decapod crustacean taxa [1986, eng] **B-36460**
Distribution of Tanaidacea [1986, eng] **B-36461**
New species of Ancorabolidae from Macquarie I. [1987, eng] **B-36537**
Distribution and community structure of pelagic shrimps in the southern ocean between 150E and 115E [1987, eng] **B-36618**
Taxonomy of freshwater crustaceans on Deception I. [1987, spa] **B-36726**
Spatial distribution of antarctic krill off Queen Maud Land [1986, eng] **B-36751**
Krill and zooplankton distribution, Antarctica to the sub-tropics [1986, eng] **B-36752**
Pelagic shrimps (Crustacea:Decapoda) from the southern ocean between 150E and 115E [1987, eng] **B-36792**
Distribution, abundance and population of krill in Prydz Bay [1988, eng] **B-36821**
Zooplankton communities in the southern Weddell Sea (Antarctica) [1988, eng] **B-36822**
Krill biomass and distribution in Bransfield Strait in summer 1985 [1987, spa] **B-37040**
Zonophryxus quinquedens Barnard (Isopoda, Epicaridae, Dajidae) in South Orkney Islands waters [1987, eng] **B-37395**
South African SIBEX II survey, Prydz Bay, 1985: preliminary results [1987, eng] **J-37345**
MIGRATION
Krill stock structure and composition in Bransfield Strait [1986, eng] **B-34691**
MORPHOLOGY
Polymorphism and distribution of *Ceratoserolis trilobitoides* in Weddell Sea [1986, eng] **B-34661**
Variations in krill size in small swarms [1986, eng] **B-34795**
Pelagic shrimp of the family Oplophoridae from Pacific southern ocean [1986, eng] **B-34798**
Crustacea Tanaidacea of the Antarctic and the Subantarctic [1986, eng] **B-34823**
Differences between krill swarms and implications for population sampling [1986, eng] **B-34835**
Growth and longevity of krill during the first decade of pelagic whaling [1986, eng] **B-34839**
Harpacticoid n.sp. from South Orkney Is. and redescription of *Idyellopsis typica* [1986, eng] **B-34861**
Latitudinal variation of fecundity and embryonic development of *Ceratoserolis trilobitoides* [1987, eng] **B-34917**
Visual pigment and photoreception of the antarctic krill, *Euphausia superba* (Crustacea, Euphausiacea) [1981, eng] **B-35055**
Revision of the genus *Batheuchaeta* (Calanoida, Aetideidae) [1986, rus] **B-35125**
Ampelisca macrodonta n.sp. from Falkland Is. [1987, eng] **B-35488**
Fish parasite *Gnathia calva* Vanhöffen and synonymy with *Heterognathia* Amar & Roman [1987, eng] **B-35611**
Krill gonad history during breeding season [1987, eng] **B-35719**
Ornamentation changes on carapaces of Falkland Island crabs [1987, eng] **B-36015**
Two sibling species of the *Tigriopus angulatus* group from Crozet and Kerguelen Is. [1987, fre] **B-36108**
Mature krill grown from eggs in laboratory [1987, eng] **B-36112**
Drescheriella glacialis n. gen., n. sp. in sea ice [1987, eng] **B-36223**
Spermatophore dimorphism in *Euchaeta antarctica* [1987, eng] **B-36308**
Sexual differentiation in antarctic krill [1987, eng] **B-36309**
New species of Ancorabolidae from Macquarie I. [1987, eng] **B-36537**
Morphological variation of parasite of the genus *Pennella* Oken [1987, eng] **B-36543**
New species of Harpacticoid Copepod from Crozet Is. [1986, fre] **B-36561**
Laboratory postembryonic development of *Drescheriella glacialis* [1987, eng] **B-36616**
Symbiontic bacteria in an antarctic isopod parasitic on fish [1987, eng] **B-36680**
Taxonomy of freshwater crustaceans on Deception I. [1987, spa] **B-36726**
Pelagic shrimps (Crustacea:Decapoda) from the southern ocean between 150E and 115E [1987, eng] **B-36792**
New Copepod from Macquarie I. [1987, eng] **B-36888**
Morphology of the gastric mill in ten species of euphausiids [1988, eng] **B-37099**
New records for *Physetocaris microphthalma* Chace (Decapoda, Caridea, Physetocarididae) from the South Pacific [1985, eng] **B-37158**
Zonophryxus quinquedens Barnard (Isopoda, Epicaridae, Dajidae) in South Orkney Islands waters [1987, eng] **B-37395**
Thelycum and spermatophore structure in *Euphausia superba* and *E. crystallorophias* [1987, eng] **B-37456**

Comparative morphology of filtering structure in 5 euphausiids [1987, eng] **B-37457**
Four n.sp. of cumacean crustaceans [1987, eng] **B-37462**
Biomechanics of filter feeding in krill [1988, eng] **B-37498**

NUTRITION

Spring primary productivity and krill in Bransfield Strait [1986, eng] **B-34663**
Scavenging and other feeding habits of lysianassid amphipods from McMurdo Sound [1986, eng] **B-34665**
Biochemistry of organic particulate matter in the Indian Ocean in 1984 [1987, fre] **B-35227**
Biomass, distribution, and trophodynamics of *Salpa thompsoni* in the Scotia Sea near the Antarctic Peninsula, austral summer 1983-1984 [1985, eng] **B-35370**
Euphausia superba: a preliminary report on three areas of investigation [1985, eng] **B-35373**
Phytoplankton variability and krill distribution [1984, eng] **B-35423**
Krill overwintering strategy under fast ice in Lützow-Holm Bay [1986, eng] **B-35660**
Krill feeding behavior and particle selectivity [1986, eng] **B-35662**
Laboratory observations of molting and growth of krill [1986, eng] **B-35665**
Kelp degradation by fly larvae at Marion I. [1987, eng] **B-36121**
Molting and growth of juvenile krill in feeding experiment [1987, eng] **B-36224**
Enzyme activity in krill. Immunology [1987, eng] **B-36700**
Radioisotope study of ingested palmitic acid in antarctic krill [1987, eng] **B-36841**
Midwater food web in McMurdo Sound [1987, eng] **B-36865**
Omnivorous feeding behavior of the antarctic krill *Euphausia superba* [1988, eng] **B-37098**

Two series of macrozooplankton catches in the Indian Ocean [1987, eng] **B-37458**
Ice algae as food of an antarctic ice-associated copepod, *Paralabidocera antarctica* (I.C. Thompson) [1987, eng] **B-37460**
Biomechanics of filter feeding in krill [1988, eng] **B-37498**

PATHOLOGY

Aspects of ecology and biogeography of acanthocephala in antarctic seabirds [1986, eng] **B-37476**

PHYSIOLOGY

Krill processing for human consumption [1986, eng] **B-34696**
Heat coagulation of centrifuged raw krill mince [1986, eng] **B-34697**
Values of food hydrolysates from fish and krill [1985, rus] **B-34731**
Carotenoids in frozen antarctic krill and in some of its semifinished products [1985, eng] **B-34747**
Amino acid changes in canning of shrimp [1986, rus] **B-34825**
1-O-alkylglycerolipids in antarctic krill *(Euphausia superba* Dana) [1986, eng] **B-34834**
Fluoride content in krill tissue in relation to molt cycle [1987, eng] **B-34921**
Physical and chemical properties of krill chitin [1986, jpn] **B-34928**
Supercritical carbon dioxide extraction of oils from antarctic krill [1986, eng] **B-34937**
Visual pigment and photoreception of the antarctic krill, *Euphausia superba* (Crustacea, Euphausiacea) [1981, eng] **B-35055**
Changes in 5'-inosine monophosphate during sterilization of krill meat [1985, rus] **B-35237**
Manufacture of crab meat-textured protein fiber from antarctic krill [1986, jpn] **B-35238**
Changes of non-protein nitrogens fractions in krill during storage [1986, eng] **B-35290**
Krill chitin and metal transport in sea water [1986, eng] **B-35585**
Seasonal variation of krill autoproteolytic activity [1986, eng] **B-35600**
Krill fluoride content in relation to size and regional origin [1986, eng] **B-35601**
Fluoride turnover in birds [1987, eng] **B-35619**
Adsorption of enzymes of krill chitin modified with carbon disulfide [1987, eng] **B-35621**
Lipid content and composition of some midwater crustaceans from the southern ocean [1986, eng] **B-35622**
Krill overwintering strategy under fast ice in Lützow-Holm Bay [1986, eng] **B-35660**
Krill feeding behavior and particle selectivity [1986, eng] **B-35662**
Laboratory observations of molting and growth of krill [1986, eng] **B-35665**
Debriding ability of a novel multi-enzyme preparation isolated from antarctic krill *(Euphausia superba)* [1987, eng] **B-36100**
Two sibling species of the *Tigriopus angulatus* group from Crozet and Kerguelen Is. [1987, fre] **B-36108**
Mature krill grown from eggs in laboratory [1987, eng] **B-36112**
Separation of lipophilic fractions by high-performance liquid chromatography [1986, eng] **B-36192**
Molting and growth of juvenile krill in feeding experiment [1987, eng] **B-36224**
Metabolic rates and elemental composition of krill [1987, eng] **B-36227**
Female-specific protein in krill [1986, eng] **B-36243**
Vertical distribution of krill larvae in Bransfield Strait, 1982-1983 [1986, eng] **B-36245**
Krill population age structure near the Antarctic Peninsula [1987, rus] **B-36282**
Lab studies of sexual processes in female antarctic krill [1987, eng] **B-36293**
Sexual differentiation in antarctic krill [1987, eng] **B-36309**
Biochemistry of the autolytic processes in antarctic krill *Post mortem* [1987, eng] **B-36400**
Symbiontic bacteria in an antarctic isopod parasitic on fish [1987, eng] **B-36680**
Crystallinity of krill chitin and its derivatives [1987, eng] **B-36684**
Enzyme activity in krill. Immunology [1987, eng] **B-36700**
Enzyme polymorphism in antarctic krill *(Euphausia superba);* the phosphoglucomutase locus [1987, eng] **B-36724**
Fatty acids and sterols in the amphipod *Themisto gaudichaudii* Guerin 1828 [1988, eng] **B-36801**
Radioisotope study of ingested palmitic acid in antarctic krill [1987, eng] **B-36841**
Biology of the antarctic euphausiid *Thysanoessa macrura* G.O. Sars from the Atlantic sector of the Antarctic [1987, rus] **B-36945**
Pigmentation of juvenile coho salmon with carotenoid oil extracted from antarctic krill [1987, eng] **B-36969**
Studies on the spinnability of antarctic krill muscle proteins treated with alkali [1987, eng] **B-37091**
Spinnability of antarctic krill muscle proteins and the behavior of spinning dope [1987, eng] **B-37092**
Purification of laminarinase from antarctic krill *Euphausia superba* [1987, eng] **B-37094**
Goose barnacle *Lepas australis* in fouling subantarctic waters [1987, eng] **B-37120**
Aspects of the life-cycle of the antarctic fish parasite *Gnathia calva* Vanhöffen (Crustacea: Isopoda) [1988, eng] **B-37126**
Seasonal changes in krill's nitrogen fractions [1987, eng] **B-37171**
Simulation by 2-mercaptoethanol and alcohols of protease in antarctic krill, *Euphausia superba,* at low temperatures [1987, eng] **B-37256**
Energy sources for recruitment of a subantarctic copepod [1987, eng] **B-37286**
Enzymatic activities of psychrotrophic bacteria from antarctic krill [1987, eng] **B-37400**
Polymorphism of phosphoglucomutase (PGM) in antarctic krill, determined by the isoelectric focusing technique (IEF) [1987, eng] **B-37401**
Longevity of the antarctic krill *(Euphausia superba* Dana) based on a laboratory experiment [1987, eng] **B-37455**
Comparative morphology of filtering structure in 5 euphausiids [1987, eng] **B-37457**
Distribution of heavy metals in antarctic marine ecosystem [1987, eng] **B-37464**
Heavy metal accumulation in antarctic krill *Euphausia superba* [1987, eng] **B-37465**
Biomechanics of filter feeding in krill [1988, eng] **B-37498**
Hoploparia stokesi from the Lopez de Bertodano Formation, Seymour I. [1987, eng] **E-36954**

POPULATION

Germany's participation in SIBEX and CCAMLR [1986, eng] **B-34689**

Arthropoda-Crustacea

Long-period geomagnetic pulsations in high-latitude magnetically conjugate regions [1986, eng] **K-36264**
Upper atmosphere physics data, Syowa Station, 1985 [1987, eng] **K-36574**
Geomagnetically conjugate phenomena since the IGY [1987, eng] **K-36630**
VLF wave injection, experiments from Siple Station, Antarctica [1987, eng] **K-36634**
Magnetic conjugacy as observed at the apex of field lines: Geos-1 and -2 results [1987, eng] **K-36635**
Ionosonde measurements at Marsh, King George Island: first results [1987, eng] **K-36651**
Spectral characteristics of Pc 3 and Pc 4/5 magnetic pulsation bands observed near L=6 [1984, eng] **K-36905**
Spectral analyses of ionospheric and magnetic disturbances [1987, spa] **K-37134**
Occurrence map of broad-band auroral VLF hiss [1988, eng] **K-37444**
MODELS
Comparison of experimental and computed long-range oblique-sounding ionograms on the Moscow-Molodezhnaya (Antarctica) path [1985, eng] **K-35136**
Model predictions of subionospheric VLF signal perturbations [1986, eng] **K-35406**
Frequency limits and modal structure of signals on the Moscow-Molodezhnaya route [1985, rus] **K-35637**
Pulsating aurora and magnetic Pi(c) pulsations [1987, eng] **K-35957**

Middle atmosphere winds at Mawson. 1. Mean circulation and large scale motions [1987, eng] K-35961
Middle atmosphere winds at Mawson. 2. Tides [1987, eng] K-35962
Thermosphere dynamics over Mawson. 1. Diurnal variation and geomagnetic dependence [1987, eng] K-35964
Thermosphere dynamics over Mawson. 4. Lower thermosphere [1987, eng] K-35967
Radio wave propagation over the Moscow-Antarctica path [1986, rus] K-36198
Hemispheric asymmetries in thermospheric structure and dynamics [1987, eng] K-36637
Comparison of gorund-based ionospheric measurements and the USU ionospheric model [1987, eng] K-36647
Magnetic field measurements in the ionosphere-magnetosphere region [1986, eng] K-36898
Dayside pulsation events near the plasmapause [1986, eng] K-36903
Conjugacy of visual auroras during magnetically quiet periods [1969, eng] K-36904
Thermospheric dynamics: modelling [1987, eng] K-37188
Auroral model for the NCAR thermospheric general circulation model (TGCM) [1987, eng] K-37190
Some aspects of geomagnetically conjugate phenomena [1987, eng] K-37191
Normal modes as simulated in a three-dimensional circulation model of the middle atmosphere including regional gravity wave activity [1987, eng] K-37276
Thermospheric structure associated with discrete levels of auroral activity [1988, eng] K-37442

Atmospherics

Observations of auroral LHR noise by the sounding rocket S-310JA-6 [1987, eng] K-35606
See also: ELF emissions; VLF emissions

Aurora

Magnetospheric data received by an unmanned Japanese antarctic station [1986, eng] G-34712
MAP observations at Syowa Station in 1985 [1987, eng] I-36643
Japanese MAP results in Antarctica [1987, eng] I-36644
Aurora observation using the Showa Station 50-MHz Doppler radar [1986, eng] K-34688
Spatial distribution of anomalous phenomena in the southern high-latitude winter ionosphere from earth-based data [1984, eng] K-35305
View of the upper atmosphere from Antarctica [1985, eng] K-35430
Pc 1 magnetic pulsations at the South Pole [1985, eng] K-35549
Poleward surges of auroral phenomena over the South Pole [1985, eng] K-35550
Seasonal variations in auroral absorption [1985, eng] K-35552
Long-term variations in solar radio noise [1985, eng] K-35553
Solar wind related to high latitude auroral absorption events [1986, eng] K-35577
Observations of auroral LHR noise by the sounding rocket S-310JA-6 [1987, eng] K-35606
On the conjugacy of the aurora: high and low latitudes [1987, eng] K-35952
OH nightglow and temperature at Davis [1987, eng] K-35969
Auroral zone conjugate point observations, 1985 [1987, eng] K-36058
Ground and space measurements of a south polar auroral surge [1987, eng] K-36310
Atmospheric studies by optical methods [1987, eng] K-36518
Aurora observations at Syowa Station in 1984 [1985, jpn] K-36621
Rocket shooting into aurora australis in 1984 [1985, jpn] K-36622
Geomagnetically conjugate phenomena since the IGY [1987, eng] K-36630
Pc 1 pearl-electron interactions [1983, eng] K-36916
Spectral characteristics of magnetic Pi 2 pulsations [1981, eng] K-36918
Auroral model for the NCAR thermospheric general circulation model (TGCM) [1987, eng] K-37190
Some aspects of geomagnetically conjugate phenomena [1987, eng] K-37191
Auroral occurrence from 1963 to 1970 as observed at Dumont d'Urville Station [1986, eng] K-37277
Anticorrelation between strengths of internal and transient external magnetic fields? [1986, eng] K-37279
Electron density in the auroral atmosphere [1988, eng] K-37432
Height variations of auroral hiss observed by S-310JA-11 and -12 rockets [1988, eng] K-37434
Modulations of low energy electron flux in the ionosphere [1988, eng] K-37435
Auroral X-ray images over Showa Station [1988, eng] K-37436
Occurrence map of broad-band auroral VLF hiss [1988, eng] K-37444
Whistler emissions at low altitudes over Antarctica [1988, eng] K-37445

DISTRIBUTION

Distribution of aurora irregularities over the southern polar cap [1986, eng] K-36445
Conjugacy of electron auroras observed by all-sky cameras and scanning photometers [1987, eng] K-36632
Statistics of auroral radio absorption at Siple and South Pole [1987, eng] K-36648
Features of the polar cap aurorae in the southern polar region [1988, eng] K-37512

DIURNAL VARIATIONS

Morphology of the midday radio aurora in the Southern Hemisphere [1987, eng] K-35960
Statistics of auroral radio absorption at Siple and South Pole [1987, eng] K-36648

FORMS AND SPECIAL TYPES

Conjugacies of pulsating auroras by all-sky TV observations [1987, eng] K-35596
Ionospheric irregularities around L=4 using satellite beacons [1987, eng] K-35971
Conjugacy of rapid motions and small-scale deformations of discrete auroras by all-sky TV observations [1987, eng] K-36633
Dayside auroras [1987, jpn] K-36731
Features of the polar cap aurorae in the southern polar region [1988, eng] K-37512

INTENSITY

Showa Station rocketsonde experiment with aurora [1987, eng] K-36056
Upper atmosphere physics data, Syowa Station, 1985 [1987, eng] K-36574
Conjugacy of electron auroras observed by all-sky cameras and scanning photometers [1987, eng] K-36632
Correlated pulsations in auroral light intensity and narrow band VLF emissions [1986, eng] K-36687

MORPHOLOGY

Statistics of auroral radio absorption at Siple and South Pole [1987, eng] K-36648

PARTICLES

Periodic TIDs in both hemispheres following auroral disturbances [1987, eng] K-35970
Particle precipitation patterns in southern hemisphere high latitudes, longitude dependence [1987, eng] K-36642
Particle precipitation into the middle atmosphere by changes in the IMF [1987, eng] K-36769
Auroral X-ray images using telescopes at balloon altitude [1988, eng] K-37437
Thermospheric structure associated with discrete levels of auroral activity [1988, eng] K-37442
Preliminary results of the multimode FM/CW ionosonde experiment [1988, eng] K-37448

RADIO STUDIES

Radio auroral observations at the daytime cusp [1983, eng] K-35301
Records of radio aurora at Showa Station, 1985 [1987, eng] K-35702
Morphology of the midday radio aurora in the Southern Hemisphere [1987, eng] K-35960
Effects of magnetic activity and the IMF on southern polar radio aurorae [1988, eng] K-37513

VISUAL

Polar aurora from Salyut-6 during geomagnetic storm, Apr. 11-13, 1981 [1985, eng] K-35137
Monochromatic auroral images at Showa Station [1987, eng] K-35882
Pulsating aurora and magnetic Pi(c) pulsations [1987, eng] K-35957
Ionospheric irregularities around L=4 using satellite beacons [1987, eng] K-35971

Aurora
VISUAL *(cont.)*
Conjugacy of electron auroras observed by all-sky cameras and scanning photometers [1987, eng] **K-36632**
Conjugacy of rapid motions and small-scale deformations of discrete auroras by all-sky TV observations [1987, eng] **K-36633**
Conjugacy of visual auroras during magnetically quiet periods [1969, eng] **K-36904**
Auroral zones
Collective geomagnetic response in several antarctic stations [1984, eng] **K-35241**
Thermosphere dynamics over Mawson. 2. Y component of magnetic field [1987, eng] **K-35965**
Thermosphere dynamics over Mawson. 3. Wind field horizontal divergence [1987, eng] **K-35966**
Thermosphere dynamics over Mawson. 4. Lower thermosphere [1987, eng] **K-35967**
Ionospheric irregularities around L=4 using satellite beacons [1987, eng] **K-35971**
Australia's magnetospheric research in Antarctica [1987, eng] **K-35976**

Distribution of seabirds in the Bouvet Island area in winter 1982 [1987, rus] **B-36946**
Ornithofauna of Fildes Peninsula [1987, rus] **B-37073**
Avifauna of Fildes Peninsula [1987, eng] **B-37487**
MARKING
Ornithological investigations at Palmer Station: the first long-distance tracking of seabirds by satellites [1985, eng] **B-35378**
Recovery of banded seabirds from South Shetland Is. [1987, spa] **B-37043**
MORPHOLOGY
Notes on the avifauna of South Georgia [1978, eng] **B-34845**
NUTRITION
Food of the Cape Pigeon from Princess Elizabeth Land [1986, eng] **B-35019**
Marine ecology of Ross Sea birds [1984, eng] **B-35215**
Fluoride turnover in birds [1987, eng] **B-35619**
Seabirds: feeding ecology and role in marine ecosystems [1987, eng] **B-36047**
Seabirds as predators on marine resources, especially krill, at South Georgia [1987, eng] **B-36051**
Feeding of seabirds and killer whales at Crozet Is. [1987, eng] **B-36401**
Seabird ecology [1987, eng] **B-37198**
Factors regulating the distribution patterns of seabirds [1987, eng] **B-37398**
Falklands' Johnny rook [1986, eng] **B-37418**
PATHOLOGY
Nearshore foodwebs and the distribution of acanthocephalan parasites in antarctic seabirds [1985, eng] **B-35377**
Reighardia sternae (Diesing, 1864) (Pentastomida) from seabirds in Antarctica [1987, eng] **B-36964**
Polychlorinated biphenyls in marine migratory birds on King George I. [1987, eng] **B-37173**
Aspects of ecology and biogeography of acanthocephala in antarctic seabirds [1986, eng] **B-37476**
PHYSIOLOGY
Buffering capacity in marine and terrestrial vertebrate muscles [1981, eng] **B-35013**
Fluoride turnover in birds [1987, eng] **B-35619**
Distribution of heavy metals in antarctic marine ecosystem [1987, eng] **B-37464**
POPULATION
Notes on the avifauna of South Georgia [1978, eng] **B-34845**
Marine ecology of Ross Sea birds [1984, eng] **B-35215**
Preliminary data on seabird distribution in the southwestern Indian Ocean [1987, fre] **B-35230**
Distribution of marine birds off Wilkes Land, February 1985 [1985, eng] **B-35379**
Distribution of marine birds and their prey in Bransfield Strait and southern Drake Passage [1985, eng] **B-35380**
Birds of Scullin Monolith [1987, spa] **B-36387**
Breeding status of birds on George V Coast [1987, eng] **B-36469**
Distribution of seabirds in the Bouvet Island area in winter 1982 [1987, rus] **B-36946**
Atlas of Polish oceanographic observations in antarctic waters, 1981 [1985, eng] **B-37380**
Factors regulating the distribution patterns of seabirds [1987, eng] **B-37398**
Status and conservation of seabirds at the Falkland Islands [1984, eng] **B-37424**
Status and conservation of seabirds at Macquarie Island [1984, eng] **B-37425**

Status and conservation of birds, Ross Sea region [1984, eng] B-37426
Status and conservation of sea birds of French subantarctic islands and Adélie Land [1984, eng] B-37427
Status and conservation of sea birds on some subantarctic islands [1984, eng] B-37428
Sea birds of antarctic maritime regions, 20W to 80W [1984, eng] B-37449
Netherlands South Georgia Scientific Expedition [1988, dut] D-37503

Aves-Anseriformes
Ducks of Macquarie Island [1987, eng] B-35922
BEHAVIOR
Factors affecting the breeding performance of antarctic Blue-eyed shags *Phalacrocorax atriceps* [1986, eng] B-34687
Courtship and pairing of King and Imperial Blue-eyed shags [1986, eng] B-35409
BREEDING CYCLES AND REPRODUCTION
Factors affecting the breeding performance of antarctic Blue-eyed shags *Phalacrocorax atriceps* [1986, eng] B-34687
Courtship and pairing of King and Imperial Blue-eyed shags [1986, eng] B-35409
ECOLOGY
Factors affecting the breeding performance of antarctic Blue-eyed shags *Phalacrocorax atriceps* [1986, eng] B-34687
GEOGRAPHIC DISTRIBUTION
Bubulcus ibis and *Eudyptes chrysolophus* from South Shetland Islands [1986, spa] B-35266
PHYSIOLOGY
Fluoride excretion in Adélie penguins *(Pygoscelis adeliae)* and Mallard ducks *(Anas platyrynchos)* [1987, eng] B-36481

Aves-Charadriiformes
BEHAVIOR
South Polar and Brown skuas' activity near Palmer Station [1986, eng] B-34817
Distribution and relationships of South American skuas [1978, eng] B-34849
Fidelity in Brown skuas of Anvers island [1987, eng] B-36804
Feeding and nesting ecology of sympatric South Polar and Brown skuas [1987, eng] B-36805
Skuas—antarctic predatory gulls [1987, ger] B-36807
Sheathbills—chickens of Antarctica? [1986, ger] B-37260
Distribution, populations, and foraging behavior of terns at PEI [1987, eng] B-37350
BREEDING CYCLES AND REPRODUCTION
South Polar Skua colonies in Ross Sea region [1986, eng] B-34729
GEOGRAPHIC DISTRIBUTION
Distribution and relationships of South American skuas [1978, eng] B-34849
Skuas—antarctic predatory gulls [1987, ger] B-36807
Brown-hooded gull *Larus maculipennis:* first record for South Georgia [1988, eng] B-37117
Distribution, populations, and foraging behavior of terns at PEI [1987, eng] B-37350
MORPHOLOGY
Distribution and relationships of South American skuas [1978, eng] B-34849
NUTRITION
Food of the South Polar Skua near Davis Station [1986, eng] B-34667
Kelp gull predation on limpet *Nacella delesserti* [1985, eng] B-34832
Feeding and nesting ecology of sympatric South Polar and Brown skuas [1987, eng] B-36805
Sheathbills—chickens of Antarctica? [1986, ger] B-37260
PATHOLOGY
Filaroid nematode (Lemdaninae) from *Larus dominicanus* [1986, eng] B-35134
POPULATION
South Polar Skua colonies in Ross Sea region [1986, eng] B-34729
Distribution, populations, and foraging behavior of terns at PEI [1987, eng] B-37350

Aves-Procellariiformes
BEHAVIOR
Foraging energetics of albatrosses at Bird Island [1987, eng] B-35473
Fish prey of Wilson's storm petrel *Oceanites oceanicus* at South Georgia [1988, eng] B-37114
Feeding behavior of three species of southern albatross [1988, eng] B-37138
Role of prolactin in incubating albatross [1985, eng] B-37505
BREEDING CYCLES AND REPRODUCTION
Breeding petrels on Ardley Island [1986, spa] B-35265
Diet and reproduction in high latitude, plankton-feeding seabirds [1986, eng] B-35419
Breeding cycle in Wilson's storm petrels at King George I. [1986, eng] B-35597
Interrelationships between embryos and adult body mass in antarctic petrels [1987, eng] B-35982
Species and sexual isolating mechanisms in sibling species of giant petrels *Macronectes* [1987, eng] B-36122
Breeding of the white-chinned petrel *Procellaria aequinoctialis* [1987, eng] B-36328
Mark-recapture estimates of breeding population size in storm petrel at South Georgia [1988, eng] B-37124
Movements of southern Giant Petrels ringed near U.S. Palmer Station, Antarctica [1987, eng] B-37248
Breeding ecology of *Thalassoica antarctica* in Queen Maud Land [1987, eng] B-37463
ECOLOGY
Assimilation efficiency of White-chinned petrels fed different prey [1986, eng] B-34912
Diet and feeding ecology of *Procellariiformes* [1987, eng] B-36050
Carbon-14 investigations on petrel breeding places [1987, ger] B-36767
Breeding ecology of *Thalassoica antarctica* in Queen Maud Land [1987, eng] B-37463
Environmental modification of subantarctic peat bog by albatrosses [1987, eng] E-36699
EMBRYOLOGY
Interrelationships between embryos and adult body mass in antarctic petrels [1987, eng] B-35982
GEOGRAPHIC DISTRIBUTION
Breeding petrels on Ardley Island [1986, spa] B-35265
Breeding of the white-chinned petrel *Procellaria aequinoctialis* [1987, eng] B-36328
MARKING
Mark-recapture estimates of breeding population size in storm petrel at South Georgia [1988, eng] B-37124
Movements of southern Giant Petrels ringed near U.S. Palmer Station, Antarctica [1987, eng] B-37248
MIGRATION
Movements of southern Giant Petrels ringed near U.S. Palmer Station, Antarctica [1987, eng] B-37248
MORPHOLOGY
Identification of Soft-plumaged petrel from Macquarie Island [1986, eng] B-35021
NUTRITION
Assimilation efficiency of White-chinned petrels fed different prey [1986, eng] B-34912
Diet of the blue petrel at subantarctic Marion Island [1986, eng] B-35026
Energy expenditure of the albatross *Diomedea exulans* [1986, eng] B-35292
Energy expenditure in adult least auklets and diving petrels during the chick-rearing period [1986, eng] B-35293
Diet and reproduction in high latitude, plankton-feeding seabirds [1986, eng] B-35419
Squid beaks regurgitated by albatrosses on Prince Edward Is. [1986, eng] B-35642
Diet and feeding ecology of *Procellariiformes* [1987, eng] B-36050
Cephalopod prey of the wandering albatross [1987, eng] B-36864
Feeding behavior of subantarctic petrels [1987, eng] B-37057
Fish prey of Wilson's storm petrel *Oceanites oceanicus* at South Georgia [1988, eng] B-37114
Feeding behavior of three species of southern albatross [1988, eng] B-37138
PHYSIOLOGY
Assimilation efficiency of White-chinned petrels fed different prey [1986, eng] B-34912
Energy expenditure of the albatross *Diomedea exulans* [1986, eng] B-35292
Energy expenditure in adult least auklets and diving petrels during the chick-rearing period [1986, eng] B-35293
Diet and reproduction in high latitude, plankton-feeding seabirds [1986, eng] B-35419

Aves-Procellariiformes
PHYSIOLOGY *(cont.)*

C-14 ages of early 20th century animal remains at Cape Evans [1986, eng] **B-35298**
Population studies of Adélie, gentoo, and chinstrap penguins [1985, eng] **B-35381**
Ecological segregation of Adélie, Gentoo, and Chinstrap penguins at King George I. [1987, eng] **B-35846**
Penguins [1987, spa] **B-36527**
Penguins of the world: a bibliography [1985, eng] **B-36565**
Weddell seal preys on Chinstrap penguin [1988, eng] **B-37139**
BEHAVIOR
Study of sleep in Emperor Penguins [1986, eng] **B-34705**
Foraging parameters of gentoo penguins at Marion Island [1987, eng] **B-34922**
Foraging movements of Adelie penguins at Cape Bird [1986, eng] **B-35297**
Porpoising behavior in penguins [1987, eng] **B-35324**
Feather growth, mass loss and duration of moult in Macaroni and Rockhopper Penguins [1986, eng] **B-35641**
Eco-ethological variables in a rookery on Ardley Island [1987, spa] **B-35891**
Diving behavior and performance, with special reference to penguins [1987, eng] **B-36048**
Foraging range of King penguins at Marion Island [1987, eng] **B-36458**
Diving patterns related to diet in two South Georgia penguins [1988, eng] **B-37137**
BLOOD AND CIRCULATION
Ultrastructural histochemical demonstration of concanavalin A binding sites on Adélie penguin blood cells [1985, eng] **B-35382**
Plasma lipoproteins and atheriosclerosis in penguins [1987, spa] **B-35892**
BREEDING CYCLES AND REPRODUCTION
Gentoo penguin population and breeding at Macquarie Island [1986, eng] **B-35289**
Foraging movements of Adelie penguins at Cape Bird [1986, eng] **B-35297**
Energy requirements for growth and maintenance in macaroni and rockhopper penguins [1987, eng] **B-36617**
Recovery of banded seabirds from South Shetland Is. [1987, spa] **B-37043**
Distribution and abundance of antarctic and subantarctic penguins: a synthesis of current knowledge [1983, eng] **B-37334**
Microclimate of the nest sites of pygoscelid penguins in Admiralty Bay [1986, eng] **I-35586**
ECOLOGY
Eco-ethological variables in a rookery on Ardley Island [1987, spa] **B-35891**
Food and feeding ecology of penguins [1987, eng] **B-36049**
GEOGRAPHIC DISTRIBUTION
Bubulcus ibis and *Eudyptes chrysolophus* from South Shetland Islands [1986, spa] **B-35266**
Revised penguin numbers and distribution, Anvers Island [1987, eng] **B-36211**
Censuses of penguin populations of the Antarctic Peninsula, 1983-87 [1987, eng] **B-36842**
Distribution and abundance of antarctic and subantarctic penguins: a synthesis of current knowledge [1983, eng] **B-37334**
MARKING
Determination of penguins' foraging behavior by radiotelemetry [1986, eng] **B-34818**
MORPHOLOGY
Ultrastructural histochemical demonstration of concanavalin A binding sites on Adélie penguin blood cells [1985, eng] **B-35382**
NUTRITION
Emperor Penguin food at fast ice edge in winter and spring [1986, eng] **B-34668**
Determination of penguins' foraging behavior by radiotelemetry [1986, eng] **B-34818**
Foraging parameters of gentoo penguins at Marion Island [1987, eng] **B-34922**
Foraging movements of Adelie penguins at Cape Bird [1986, eng] **B-35297**
Foraging characteristics of king penguins from Saint Andrews Bay, South Georgia [1985, eng] **B-35384**
Ecology and physiology of fasting in King Penguin chicks [1987, eng] **B-35454**
Carotenoid composition of a lichen and of penguin feces [1986, eng] **B-35602**
Seasonal and annual diet variation in Macaroni and Rockhopper penguins at Marion I. [1987, eng] **B-35878**
Seasonal variation in the diet of King penguins at Marion I. [1987, eng] **B-35880**
Stomach flushing technique for obtaining stomach contents of penguins [1987, eng] **B-35928**
Food and feeding ecology of penguins [1987, eng] **B-36049**
Foraging range of King penguins at Marion Island [1987, eng] **B-36458**
Diving patterns related to diet in two South Georgia penguins [1988, eng] **B-37137**
King penguin changes in body mass and plasma metabolites during short-term fasting [1988, eng] **B-37140**
Diet of the King Penguin *Aptenodytes patagonicus* at Macquarie Island [1988, eng] **B-37419**
Fluorine in ornithogenic soils and minerals on King George I. [1987, eng] **E-36124**
PATHOLOGY
Gain and loss rates and biological half-life of PCBs and DDE in the bodies of Adélie penguins [1987, eng] **B-35286**
Plasma lipoproteins and atheriosclerosis in penguins [1987, spa] **B-35892**
PHYSIOLOGY
Study of sleep in Emperor Penguins [1986, eng] **B-34705**
Gain and loss rates and biological half-life of PCBs and DDE in the bodies of Adélie penguins [1987, eng] **B-35286**
Porpoising behavior in penguins [1987, eng] **B-35324**
Ultrastructural histochemical demonstration of concanavalin A binding sites on Adélie penguin blood cells [1985, eng] **B-35382**
Foraging characteristics of king penguins from Saint Andrews Bay, South Georgia [1985, eng] **B-35384**
Ecology and physiology of fasting in King Penguin chicks [1987, eng] **B-35454**
Carotenoid composition of a lichen and of penguin feces [1986, eng] **B-35602**
Feather growth, mass loss and duration of moult in Macaroni and Rockhopper Penguins [1986, eng] **B-35641**
Plasma lipoproteins and atheriosclerosis in penguins [1987, spa] **B-35892**
Stomach flushing technique for obtaining stomach contents of penguins [1987, eng] **B-35928**
Diving behavior and performance, with special reference to penguins [1987, eng] **B-36048**
Food and feeding ecology of penguins [1987, eng] **B-36049**
Heat production and thermal resistance in the little penguin *Eudyptula minor* in relation to wind speed [1987, eng] **B-36179**
Physiological changes in Emperor penguins during the natural breeding fast [1986, eng] **B-36238**
Fluoride excretion in Adélie penguins *(Pygoscelis adeliae)* and Mallard ducks *(Anas platyrynchos)* [1987, eng] **B-36481**
Energy requirements for growth and maintenance in macaroni and rockhopper penguins [1987, eng] **B-36617**
King penguin changes in body mass and plasma metabolites during short-term fasting [1988, eng] **B-37140**
Protein and lipid utilization during long-term fasting in emperor penguins [1988, eng] **B-37211**
POPULATION
Foraging parameters of gentoo penguins at Marion Island [1987, eng] **B-34922**
Gentoo penguin population and breeding at Macquarie Island [1986, eng] **B-35289**
Census of the Adélie penguin colony on Paulet Island, Weddell Sea [1985, eng] **B-35383**
Abundance of Royal penguins breeding at Macquarie Island [1987, eng] **B-35446**
Marine biological studies during the 25th JARE [1987, eng] **B-35744**

Revised penguin numbers and distribution, Anvers Island [1987, eng] B-36211
Coastal seawater bacteria and avifauna [1987, eng] B-36698
Censuses of penguin populations of the Antarctic Peninsula, 1983-87 [1987, eng] B-36842
Distribution and abundance of antarctic and subantarctic penguins: a synthesis of current knowledge [1983, eng] B-37334
Bird populations at PEI and Gough Island, 1951-1986 [1987, eng] B-37349
Research on coastal ice-free area during 26th JARE [1987, eng] G-35745

Antifreeze glycopeptides in fish [1987, eng] B-36512
Fucoxanthin pigment markers of marine phytoplankton [1987, eng] B-36551
Vesicular-arbuscular mycorrhizas at a subantarctic island [1986, eng] B-36552
Bacterial cell size and biomass in Lake Vanda [1987, eng] B-36576
Nutrients and chlorophyll *a* surface distribution between 90W and 20E [1987, eng] B-36577
Production and nutrient dynamics of plant communities on a subantarctic island [1987, eng] B-36619
Crystallinity of krill chitin and its derivatives [1987, eng] B-36684
Heliozoean genera *Pinaciophora* and *Acanthocystis* from Ellis Fjord [1987, eng] B-36695
Coastal seawater bacteria and avifauna [1987, eng] B-36698
Enzyme activity in krill. Immunology [1987, eng] B-36700
Enzyme polymorphism in antarctic krill *(Euphausia superba);* the phosphoglucomutase locus [1987, eng] B-36724
C:N ratios in two contrasting antarctic peat profiles [1987, eng] B-36733
Variable summer abundances of zooplankton off Queen Maud Land [1986, eng] B-36745
Nitrogen fixation in moss from East Ongul I. [1987, eng] B-36771
Humic substances resulting from decay of aquatic plants [1987, eng] B-36772
Histological, histochemical, and fine structural observations on the spleen of seals [1987, eng] B-36800
Fatty acids and sterols in the amphipod *Themisto gaudichaudii* Guerin 1828 [1988, eng] B-36801
Recovery from exhausting exercise in an antarctic fish, *Pagothenia borchgrevinki* [1988, eng] B-36817
Systematic position of *Smittia inclusa* Waters, an endemic antarctic bryozoan [1987, eng] B-36831
Antifreeze glycopeptides and peptides: interactions with ice and water [1986, eng] B-36874
Electropherograms of eye lens, muscle proteins and muscle esterase zymograms in fish [1985, eng] B-36878
Respiration of the antarctic fish from McMurdo Sound [1987, eng] B-36890
Differential temperature effects on the efficiency of carbon pathways in antarctic marine benthos [1987, eng] B-36895
Molecular aspects of adaptation to extreme cold environments [1986, eng] B-36899
Marine resources. Algae: potential uses in pharmacology [1987, spa] B-36981
Chlorophyll *a* distribution in Bransfield Strait in summer 1985 [1987, spa] B-37039
Luteoxanthin and Apo-12'-Violaxanthal in lichens [1987, eng] B-37042
Chemical composition and digestibility of *Poa flabellata (Tusac),* from the Falkland Islands [1986, spa] B-37084
Thermal stability of myosin rod from various species [1987, eng] B-37089
Studies on the spinnability of antarctic krill muscle proteins treated with alkali [1987, eng] B-37091
Spinnability of antarctic krill muscle proteins and the behavior of spinning dope [1987, eng] B-37092
Karyotypes of two nototheniids [1987, eng] B-37093
Purification of laminarinase from antarctic krill *Euphausia superba* [1987, eng] B-37094
Production and nutrient dynamics of plant communities on a subantarctic island [1988, eng] B-37123
King penguin changes in body mass and plasma metabolites during short-term fasting [1988, eng] B-37140
Polychlorinated biphenyls in marine migratory birds on King George I. [1987, eng] B-37173
Chlorinated hydrocarbons in adipose tissue of seals [1987, eng] B-37174
Thermophilic heterotrophs in geothermally heated soils from Mount Erebus [1988, eng] B-37181
Biochemistry of antarctic krill and blue whiting [1987, eng] B-37194
Protein and lipid utilization during long-term fasting in emperor penguins [1988, eng] B-37211
Occurrence of an isoprenoid C25 diunsaturated alkene and high neutral lipid content in antarctic sea-ice diatom communities [1988, eng] B-37238
Solute effects on ice recrystallization: an assessment technique [1988, eng] B-37255
Simulation by 2-mercaptoethanol and alcohols of protease in antarctic krill, *Euphausia superba,* at low temperatures [1987, eng] B-37256
New blood parasite in fish [1988, eng] B-37257
Energy sources for recruitment of a subantarctic copepod [1987, eng] B-37286

Biochemistry *(cont.)*
Numerical taxonomy of bacterial communities associated with a subantarctic mussel bed [1987, eng] **B-37340**
Short-term variations of bacterioplankton from Adélie Coast [1988, eng] **B-37341**
Protozoa in the microbial communities of maritime antarctic fellfields [1987, eng] **B-37366**
Enzymatic activities of psychrotrophic bacteria from antarctic krill [1987, eng] **B-37400**
Polymorphism of phosphoglucomutase (PGM) in antarctic krill, determined by the isoelectric focusing technique (IEF) [1987, eng] **B-37401**
Biological effects of natural and artificial antifreezes [1987, eng] **B-37402**
Limnological studies in the Antarctic Peninsula region [1987, eng] **B-37403**
Distribution of heavy metals in antarctic marine ecosystem [1987, eng] **B-37464**
Heavy metal accumulation in antarctic krill *Euphausia superba* [1987, eng] **B-37465**
Further study on the vertical distribution of organic constituents in an antarctic lake, Lake Vanda [1987, eng] **B-37467**
Total organic carbon in ponds of the Labyrinth [1987, eng] **B-37480**
Role of prolactin in incubating albatross [1985, eng] **B-37505**
Perennial N2 supersaturation in an antarctic lake [1987, eng] **E-35128**
Fluorine in ornithogenic soils and minerals on King George I. [1987, eng] **E-36124**
Early Miocene foraminiferal zonation, southeast Pacific basin, Antarctic [1987, eng] **E-36615**
Origins of humus variation [1986, eng] **E-36869**
Comparison of an immunoassay and a radioimmunoassay [1982, eng] **H-35009**
Staphylococcus aureus in Antarctica: carriage and attempted eradication [1986, eng] **H-35067**
Light and melatonin as biological synchronizers in man [1987, eng] **H-36413**
Bright light phase shifts human melatonin rhythm during antarctic winters [1987, eng] **H-36414**
Levels of radioactive precipitation on King George Island [1987, por] **I-36739**
Global transport and inter-reservoir exchange of carbon dioxide [1986, eng] **I-36883**
Nutrient depression in the blooming area of Prydz Bay [1986, eng] **J-35658**
FIBEX cruise to the Prydz Bay region, 1981: nutrient data [1987, eng] **J-35923**
ADBEX I cruise to the Prydz Bay region, 1982; nutrient data [1987, eng] **J-35924**
SIBEX II cruise to the Prydz Bay region, 1985: nutrient data [1987, eng] **J-35925**
ADBEX III cruise west of the Prydz Bay region, 1985: nutrient data [1987, eng] **J-35926**
Dissolved and particulate lipids in Bransfield Strait, *Antartic' 86* [1987, spa] **J-36362**
Hydrocarbons in Bransfield Strait [1987, spa] **J-36366**
Chlorophyll *a* in coastal waters [1987, eng] **J-36575**
Cumulation of chloroorganic insecticides by antarctic marine diatoms [1987, eng] **J-37172**

Biogeography
Antarctic elements in Australasian rainforests [1986, eng] **B-34936**
Life in a cold environment [1987, eng] **B-35628**
Biological resources: spatial and quantitative distribution [1987, rus] **B-36275**
Biogeographical realm Antarctica: a proposal [1987, eng] **B-36296**
Comments on Udvardy's biogeographical realm Antarctica [1987, eng] **B-36297**
Hydrology of surface waters south of Cape Town [1986, eng] **B-36564**
Littoral ecology of subantarctic islands [1987, eng] **B-36788**
Gondwana Six: stratigraphy, sedimentology, and paleontology [1987, eng] **E-35803**
Triassic vegetation and geography of the New Zealand portion of the Gondwana supercontinent [1987, eng] **E-35805**
Paleontological studies on King George I., 1986 [1987, eng] **E-36126**
Cretaceous paleogeography of Antarctica [1987, eng] **E-36133**
PHYTOGEOGRAPHY
Distribution and composition of vascular plant communities on Heard Island [1987, eng] **B-35617**
Subantarctic elements of the bryophytes in East African Highlands [1986, eng] **B-35678**
Taxonomic and nomenclatural observations on the Funariceae. Pt.4 [1986, eng] **B-36555**
Revision of the *Coprosma pumila* (Rubiaceae) [1987, eng] **B-36683**
Catalog of moss specimens from Antarctica and adjacent regions [1987, eng] **B-36692**
Vascular flora and vegetation of Ile de Croy, Iles Kerguelen [1988, eng] **B-37295**
Tree planting in the Falkland Islands [1986, eng] **B-37477**
Revision of the early Cretaceous flora from Hope Bay, Antarctica [1987, eng] **E-36796**
ZOOGEOGRAPHY
Insects of Marion and Prince Edward Islands [1986, eng] **B-35496**
Biogeographical grouping by dendrite analysis [1986, eng] **B-35604**
Distribution of eggs and larvae of Myctophidae in the South Atlantic [1986, eng] **B-35753**
Macroplankton zoogeography and community analysis [1987, ger] **B-35851**
Selection of conservation areas by arthropod fauna from islands [1986, eng] **B-35876**
Study of the fauna and distribution of benthic fish [1987, rus] **B-36276**
Contribution of Magellanic ichthyofauna to populations in antarctic waters [1987, spa] **B-36378**
Distribution and biogeography of crustacean decapods in antarctic waters [1987, spa] **B-36380**
Antarctic sponges and their peculiarities [1987, spa] **B-36386**
Paleobiogeography of two decapod crustacean taxa [1986, eng] **B-36460**
Distribution of Tanaidacea [1986, eng] **B-36461**
Distribution and community structure of pelagic shrimps in the southern ocean between 150E and 115E [1987, eng] **B-36618**
Postlarval fish distribution in South Atlantic Ocean [1987, spa] **B-36729**
Deep sea polychaete fauna formation, family Polynoidae [1984, eng] **B-36870**
Systematics, ecology and distribution of Southern Hemisphere spirorbids (Polychaeta; Spirorbidae) [1984, eng] **B-36872**
New species of Eucestoda from pelecaniform hosts [1987, eng] **B-37164**
Study of fauna and distribution of antarctic benthic fishes [1987, rus] **B-37227**
Biogeography of testate rhizopods in the southern temperate and antarctic zones [1987, eng] **B-37355**
South African and Australian fur seal [1985, eng] **B-37414**
History of whales in the Southern Hemisphere [1985, eng] **B-37415**
Late Mesozoic bipolar bivalve faunas [1986, eng] **E-35624**
Devonian vertebrates of Gondwana [1987, eng] **E-35806**
Progressive endemism in ammonite family Kossmaticeratidae after Gondwanaland breakup [1987, eng] **E-35810**

TAXONOMY
Habitat and distribution of Falkland Islands mosses [1986, spa] **B-34686**
Taxonomy and distribution of the subantarctic species of *Tortula* [1986, eng] **B-35104**
Southern Hemisphere synonyms of *Racomitrium sudeticum* (Funck) Bruch et Schimp [1986, eng] **B-35105**
Identity of *Drepanocladus fontinaliopsis* [1986, eng] **B-35593**
Taxonomy and geographic distribution of *Grimmia andreaeopsis* [1986, eng] **B-35605**
Bryum dichotomum Hedw., a species new to the Antarctic [1986, eng] **B-35646**
Ceratodon species collected on King George I. [1986, eng] **B-35648**
Moss communities in ice-free areas along Prince Harald Coast [1986, eng] **B-35676**
New or noteworthy mosses from Signy Island [1987, eng] **B-36214**
Algological study in Schirmacher and Unter-See lakes [1987, ger] **B-36454**
New species of the genus *Bryum* (Musci, Bryaceae) [1986, eng] **B-36456**
Taxonomic and nomenclatural observations on the Funariceae. Pt.4 [1986, eng] **B-36555**
Taxonomy and distribution of mosses [1987, eng] **B-37470**
Bryozoa
MORPHOLOGY
Systematic position of *Smittia inclusa* Waters, an endemic antarctic bryozoan [1987, eng] **B-36831**
TAXONOMY
Systematic position of *Smittia inclusa* Waters, an endemic antarctic bryozoan [1987, eng] **B-36831**

Echinodermata
Biochemistry of echinoderms [1987, fre] B-36791
BREEDING CYCLES AND REPRODUCTION
Echinoid and asteroid eggs and juveniles [1986, eng] B-34913
Contrasting modes of reproduction by common shallow-water antarctic invertebrates [1985, eng] B-35364
Reproductive biology of a common antarctic crinoid [1987, eng] B-36866
Three species of Ophiuroidea [1983, por] B-36876
EMBRYOLOGY
Echinoid and asteroid eggs and juveniles [1986, eng] B-34913
Are feeding larvae of asteroid demersal [1986, eng] B-35242
Contrasting modes of reproduction by common shallow-water antarctic invertebrates [1985, eng] B-35364
Development, metamorphosis and population of a sea urchin [1987, eng] B-36396
EVOLUTION
Antarctic larval starvation examined for *Odontaster validus* [1987, eng] B-36610
GEOGRAPHIC DISTRIBUTION
Accumulation effect in distribution of sea urchins [1986, rus] B-34793
Traces of past glaciation in the vertical distribution of starfish [1984, rus] B-35084
Three species of Ophiuroidea [1983, por] B-36876
Distribution and ecology of sea cucumbers in the Weddell Sea [1988, ger] B-37235
MIGRATION
Accumulation effect in distribution of sea urchins [1986, rus] B-34793
MORPHOLOGY
Feeding biology of the brittle star *Astrotoma agassizii* [1986, eng] B-34797
Brachysternaster n.gen. and *Brachysternaster chesheri* n.sp. of echinoid [1985, eng] B-34826
Reproductive biology of a common antarctic crinoid [1987, eng] B-36866
Three species of Ophiuroidea [1983, por] B-36876
Variations of *Gorgonocephalus chilensis* [1983, por] B-36877
NUTRITION
Predation upon *Laternula elliptica* in South Bay [1986, eng] B-34662
Feeding biology of the brittle star *Astrotoma agassizii* [1986, eng] B-34797
Are feeding larvae of asteroid demersal [1986, eng] B-35242
Contrasting modes of reproduction by common shallow-water antarctic invertebrates [1985, eng] B-35364
Relationship between invertebrate predation and benthic sponges [1987, eng] B-35720
Antarctic larval starvation examined for *Odontaster validus* [1987, eng] B-36610
PATHOLOGY
New genus of Ctenosculidae, of the Ascothoracida infesting asteroids [1987, eng] B-37053
PHYSIOLOGY
Echinoid and asteroid eggs and juveniles [1986, eng] B-34913
Biochemical composition of antarctic echinoderms [1987, eng] B-36298
Development, metamorphosis and population of a sea urchin [1987, eng] B-36396
POPULATION
Traces of past glaciation in the vertical distribution of starfish [1984, rus] B-35084
Development, metamorphosis and population of a sea urchin [1987, eng] B-36396
Distribution and ecology of sea cucumbers in the Weddell Sea [1988, ger] B-37235
TAXONOMY
Brachysternaster n.gen. and *Brachysternaster chesheri* n.sp. of echinoid [1985, eng] B-34826
Traces of past glaciation in the vertical distribution of starfish [1984, rus] B-35084

Ecology
Impact of tourism on the antarctic environment [1987, eng] A-35740
Natural environment and human factors on King George I. [1987, kor] A-36500
Greenpeace position on antarctic environment [1987, spa] A-36725

Ice
CORES *(cont.)*
Preliminary data on changes of lead concentrations in antarctic ice from 155,000 to 26,000 years BP [1987, eng] **F-36103**
Crystalline fabric of polar ice sheets inferred from seismic anisotropy [1987, eng] **F-36285**
Antarctic cornucopia [1987, eng] **F-36406**
Ice core links CO2 to climate [1987, eng] **F-36407**
Vostok ice core climate record [1987, eng] **F-36408**
Vostok ice core provides 160,000-year record of atmospheric CO2 [1987, eng] **F-36409**
Climatic response to atmospheric CO2 from Vostok ice core record [1987, eng] **F-36410**
Behavior of polycrystalline ice [1987, fre] **F-36425**
10-Be in polar ice [1987, eng] **F-36504**
Measurements of methanesulphonic acid in antarctic ice [1987, eng] **F-36588**
Orientation and strain of 700-m Mizuho ice core [1987, eng] **F-36604**
Contamination control for chemical analyses of antarctic ice [1987, eng] **F-36605**
Role of CaCO3 compensation in the glacial to interglacial atmospheric CO2 change [1987, eng] **F-36797**
Ice rheology parameters from long term borehole studies at Vostok Station [1987, rus] **F-36938**
Study of long period average accumulation of atmospheric precipitation in the Mirnyy Station area [1987, rus] **F-37069**
Gas hydrates in the ice of glacial covers [1987, rus] **F-37150**
CO2 record in the Byrd ice core 50,000-5,000 years BP [1988, eng] **F-37215**
Fabrics of Law Dome ice cores [1988, eng] **F-37245**
Methane concentration in the glacial atmosphere [1988, eng] **F-37323**
Orbital forcing and the Vostok ice core [1988, eng] **F-37417**
Vostok (Antarctica) ice core: atmospheric chemistry changes over the last climatic cycle (160,000 years) [1988, eng] **F-37497**
Review of the history of atmospheric CO2 recorded in ice cores [1986, eng] **I-35046**
Oxygen isotope study of thermal conditions in Central Antarctica in last 150,000 years [1987, rus] **I-36624**
Climate and methane implications in the Vostok ice core [1988, eng] **I-37516**
CRYSTALS
Antifreeze activity of antarctic fish glycoprotein and a synthetic polymer [1987, eng] **B-35099**
Antifreeze glycoproteins from polar fish blood [1986, eng] **B-35472**
Antifreeze glycopeptides and peptides: interactions with ice and water [1986, eng] **B-36874**
Solute effects on ice recrystallization: an assessment technique [1988, eng] **B-37255**
Long-term climatic changes indicated by crystal growth in polar ice [1987, eng] **F-35244**
Ice crystal growth form and mechanism at low atmospheric saturation [1986, eng] **F-35690**
Textures and fabrics of 700-m deep ice core from Mizuho Station [1986, eng] **F-35695**
Annealing recrystallization in laboratory and naturally deformed ice [1987, eng] **F-35848**
Grain growth in polar ice: Pts. 1 and 2 [1986, eng] **F-36031**
Crystallography of Patterned Lake, Framnes Mountains [1986, eng] **F-36035**
Mechanical law of anisotropic rock ice during stationary regime [1982, fre] **F-36424**
Behavior of polycrystalline ice [1987, fre] **F-36425**
Deformation induced recrystallization of ice [1986, eng] **F-36549**
Ice crystals in subsaturated air [1987, eng] **F-36603**
Fabrics of Law Dome ice cores [1988, eng] **F-37245**
Lidar cloud studies at Showa Station [1986, eng] **I-36669**
Release of active chlorine in the presence of ice particles in the stratosphere [1987, eng] **I-36896**
Effects of ice on reaction of chlorine nitrate with hydrogen chloride [1987, eng] **I-36897**
DEFORMATION
Use of sea ice for cargo unloading [1986, rus] **F-34718**
Saturated porous layer beneath active ice stream [1986, eng] **F-34864**
Annealing recrystallization in laboratory and naturally deformed ice [1987, eng] **F-35848**
Mechanical law of anisotropic rock ice during stationary regime [1982, fre] **F-36424**
Behavior of polycrystalline ice [1987, fre] **F-36425**
Deformation induced recrystallization of ice [1986, eng] **F-36549**
Ice rheology parameters from long term borehole studies at Vostok Station [1987, rus] **F-36938**
Influence of liquid phase on strain-strength energy of sea ice [1987, rus] **F-37066**
DENSITY
Volume expansion of a 413.5-m Mizuho core after its recovery [1986, eng] **F-35696**
DISTRIBUTION
Abrupt climate change and extinction events in Earth history [1988, eng] **I-37384**
DRIFTING
Ice dynamics [1986, eng] **F-35393**
DRILLING
Recommendations for a U.S. ice coring program [1986, eng] **F-34741**
Development of an ice core drill for liquid-filled holes [1986, eng] **F-35697**
Results of hole drilling with non-freezing fluid at Gornaia base [1986, rus] **F-36200**
Temperature distribution in the antarctic ice cover along the profile Mirnyy Observatory-Vostok Station [1987, rus] **F-37149**
Gas hydrates in the ice of glacial covers [1987, rus] **F-37150**
FLOW
Historical sand sources in the MSSTS-1 core [1986, eng] **E-34808**
Ice streams draining into the Ross Ice Shelf [1987, eng] **F-35754**
Velocity of ice streams B and C, Antarctica [1987, eng] **F-36130**
Mechanical law of anisotropic rock ice during stationary regime [1982, fre] **F-36424**
Behavior of polycrystalline ice [1987, fre] **F-36425**
Ice rheology parameters from long term borehole studies at Vostok Station [1987, rus] **F-36938**
Consequences of experimental transient rheology [1987, eng] **L-36508**
FORMATION
Antifreeze glycoproteins from polar fish blood [1986, eng] **B-35472**
Antifreeze glycopeptides and peptides: interactions with ice and water [1986, eng] **B-36874**
Ice dynamics [1986, eng] **F-35393**
Freezing rate determination by the isotopic composition of the ice [1987, eng] **F-36607**
Position of the lower surface of the Ross Ice Shelf, Antarctica [1988, eng] **F-37271**
Chemical tests of antarctic hygroscopic aerosols [1985, eng] **I-35539**
Stratospheric aerosol descent in winter and effects on water vapor budget [1986, eng] **I-35688**
Helium-3 balance of the upper layers of the northwest Weddell Sea [1987, eng] **J-36101**
INSTRUMENTS
ARAMIS remote sensing system [1987, eng] **A-36212**
Ice borehole gas sampler for isotopic dating [1984, rus] **F-35077**

Investigation of cavity formation in the ice sheet for liquid or gas sampling [1987, rus] F-36939
Unsteady plane flow of ice-sheets: a parabolic problem with two moving boundaries [1987, eng] F-37017
Surging potential of ice sheets [1986, eng] F-37154
Melting history of the Late Pleistocene antarctic ice sheet [1988, eng] F-37370
Comment on "Atmospheric boundary layer modification in the marginal ice zone" by T.J. Bennett, Jr. and K. Hunkins [1987, eng] I-35415
Ice calving, carbon dioxide and control of ice ages [1985, eng] I-36012
Modelling of Quaternary glaciations [1987, rus] I-36625
Circulation changes induced by the removal of antarctic sea ice in a July general circulation model [1986, eng] I-36661
Numerical study of the response of the southern ocean and its sea ice to a CO2-induced atmospheric warming [1986, eng] J-37309

MORPHOLOGY
Crystallography of Patterned Lake, Framnes Mountains [1986, eng] F-36035
PHYSICAL PROPERTIES
19th General Assembly, Vancouver, Canada, Aug. 9-22, 1987. Programme and abstracts [1987, eng] A-36203
Snow and ice features shown by thematic mapper and MSS images [1987, eng] F-36073
Mechanical behavior of anisotropic polar ice [1987, eng] F-36286
Sulphuric acid at grain boundaries in antarctic ice [1988, eng] F-37005
POLLUTION
Effective age of bubbles in polar ice [1985, eng] F-35027
Grain growth in polar ice: Pts. 1 and 2 [1986, eng] F-36031
Preliminary data on changes of lead concentrations in antarctic ice from 155,000 to 26,000 years BP [1987, eng] F-36103
NRM in snow and ice containing rock dust [1987, eng] F-36606
Master index for the carbon dioxide research State-of-the Art Report series [1987, eng] I-36571
Cumulation of chloroorganic insecticides by antarctic marine diatoms [1987, eng] J-37172
RADIOACTIVITY
Ice borehole gas sampler for isotopic dating [1984, rus] F-35077
STRATIGRAPHY
Tephra in ice cores from Vostok and Amundsen-Scott stations [1987, eng] E-36506
Two Be-10 peak depositions in ice during last glaciation [1987, eng] F-35322
Grain growth in polar ice: Pts. 1 and 2 [1986, eng] F-36031
STRUCTURE
Firn studies at upstream B, Siple Coast [1985, eng] F-35194
Textures and fabrics of 700-m deep ice core from Mizuho Station [1986, eng] F-35695
Grain growth in polar ice: Pts. 1 and 2 [1986, eng] F-36031
Deformation induced recrystallization of ice [1986, eng] F-36549
SURFACE FEATURES
Contemporary methods in antarctic cartography [1986, rus] C-35632
Ice streams draining into the Ross Ice Shelf [1987, eng] F-35754
TEMPERATURE
Effect of brine on sea ice heat conductivity [1986, rus] F-34716
Major events in Neogene isotopic records [1986, eng] F-35249
Crystalline fabric of polar ice sheets inferred from seismic anisotropy [1987, eng] F-36285
Helium-3 balance of the upper layers of the northwest Weddell Sea [1987, eng] J-36101
THAWING
Antifreeze glycopeptides and peptides: interactions with ice and water [1986, eng] B-36874
THICKNESS
Velocity of ice streams B and C, Antarctica [1987, eng] F-36130
Response of climate-driven sea ice model to ocean heat flux [1982, eng] F-36511
VARIATIONS
Nitrate deposition in Antarctica; temporal and spatial variations [1986, eng] F-35469
Azimuthal dependence in the gravity field [1987, eng] L-36507
VOLUME
Diatom biostratigraphy and paleoecology with a Cenozoic history of antarctic ice sheet [1986, eng] E-36020
Ocean drilling details steps to an icy world [1987, eng] E-36217
Major events in Neogene isotopic records [1986, eng] F-35249
Volume expansion of a 413.5-m Mizuho core after its recovery [1986, eng] F-35696
Response of climate-driven sea ice model to ocean heat flux [1982, eng] F-36511
Cryosphere—neglected component of the climate system [1987, eng] F-36986
Latest Miocene delta O-18 changes, ice volume and sea level [1986, eng] J-34684
Pliocene variations of Antarctic Convergence in southwest Atlantic [1986, eng] J-34713

Ice breaking
Ramming methods of ice breaking in Antarctica [1985, rus] F-37006
Canadian participation in the Polar Class trafficability program [1986, eng] G-35404

Magnetic field (in space)
Observations of the effects of DPY currents at sub-auroral latitudes [1986, eng] **K-34682**
Flux transfer events in the polar ionosphere [1986, eng] **K-34911**
Catalog of interplanetary magnetic field sector polarity, 1981-1982 [1984, rus] **K-35087**
Collective geomagnetic response in several antarctic stations [1984, eng] **K-35241**
Radio auroral observations at the daytime cusp [1983, eng] **K-35301**
Diagnostics of the dayside cusp with a northern direction of interplanetary field [1983, eng] **K-35303**
Magnetic disturbances from interplanetary magnetic field in in polar cap in summer [1984, eng] **K-35304**
Spatial distribution of anomalous phenomena in the southern high-latitude winter ionosphere from earth-based data [1984, eng] **K-35305**
North-south asymmetry of galactic cosmic rays [1986, eng] **K-35433**
Pc 1 magnetic pulsations at the South Pole [1985, eng] **K-35549**
Large-amplitude oscillations of subionospheric VLF signals [1985, eng] **K-35556**
Pc 3 pulsations observed near the south polar cusp [1986, eng] **K-35583**
ULF geomagnetic power at cusp latitudes in response to upstream solar wind conditions [1987, eng] **K-35609**
Pc3 magnetic pulsations at Davis [1987, eng] **K-35956**
Pulsating aurora and magnetic Pi(c) pulsations [1987, eng] **K-35957**
Ground-satellite studies of Pc1 pulsation propagation [1987, eng] **K-35959**
Thermosphere dynamics over Mawson. 2. Y component of magnetic field [1987, eng] **K-35965**
Thermosphere dynamics over Mawson. 3. Wind field horizontal divergence [1987, eng] **K-35966**
Global characteristics of northward IMF-associated (NBZ) field-aligned currents [1987, eng] **K-36127**
Distribution of aurora irregularities over the southern polar cap [1986, eng] **K-36445**

Magnetic field (in space) *(cont.)*
Magnetic conjugacy as observed at the apex of field lines: Geos-1 and -2 results [1987, eng] **K-36635**
Conjugate studies of hydromagnetic waves [1987, eng] **K-36636**
Cosmic noise absorption at South Pole and Frobisher Bay: initial results [1987, eng] **K-36638**
Electrodynamics and magnetohydrodynamics of geospace [1987, eng] **K-36641**
Particle precipitation patterns in southern hemisphere high latitudes, longitude dependence [1987, eng] **K-36642**
Particle precipitation into the middle atmosphere by changes in the IMF [1987, eng] **K-36769**
Magnetic field measurements in the ionosphere-magnetosphere region [1986, eng] **K-36898**
Pc3 magnetic pulsations at Davis, Antarctica [1987, eng] **K-37051**
Interplanetary and geophysical effects of a coronal transient [1987, eng] **K-37183**
Cosmic ray latitude surveys in the Atlantic Ocean area [1987, eng] **K-37184**
Thermospheric neutral wind measurements for both hemispheres [1987, eng] **K-37189**
Fluctuations of cosmic rays during periods of disturbances [1987, eng] **K-37239**
Rocket sounding of the auroral magnetic field [1988, eng] **K-37430**
Oscillation characteristics of Pi2 in auroral zone: Syowa-Iceland conjugate study [1988, eng] **K-37443**
Thermospheric wind response to driving forces in the vicinity of the Harang discontinuity [1988, eng] **K-37473**
Effects of magnetic activity and the IMF on southern polar radio aurorae [1988, eng] **K-37513**

Mammalia
Alien species at Prince Edward Islands [1986, eng] **B-35517**

Biological resources: spatial and quantitative distribution [1987, rus] B-36275
Behavior of marine mammals [1983, rus] B-37186
Studies of sea mammals in south latitudes [1985, eng] B-37409
BEHAVIOR
Selective advantages of alien predators on Marion Island [1986, eng] B-35520
BLOOD AND CIRCULATION
Anatomy of the heart of beluga whale *(Delphinapterus leucas)* [1987, eng] B-35413
ECOLOGY
Coprostanols in marine sediments as biomarker for marine mammal pollution [1986, eng] J-35112
EXPLOITATION
Conservation of living marine resources [1987, eng] B-35738
Experimental animals for medical research [1986, rus] H-36235
GEOGRAPHIC DISTRIBUTION
Range expansion of reindeer on South Georgia [1987, eng] B-36215
Paleogeography, paleoclimatology and therapsid distribution [1986, eng] E-35893
MIGRATION
Paleogeography, paleoclimatology and therapsid distribution [1986, eng] E-35893
MORPHOLOGY
Anatomy of the heart of beluga whale *(Delphinapterus leucas)* [1987, eng] B-35413
Signs of adaptation to high altitude in albino rats [1986, rus] B-36236
NUTRITION
Diet of the introduced rodents *Mus musculus* L. and *Rattus rattus* L. on subantarctic Macquarie Island [1986, eng] B-34819
Heavy metal accumulation and changes in southern minke whales [1987, eng] B-35312
Variability in vegetative and reproductive biomass in *Acaena adscendens* Vahl. (Rosaceae) at Kerguelen (South Indian Ocean) [1985, eng] B-35527
Reindeer influence on South Georgia vegetation [1987, eng] B-36830
Seabird ecology [1987, eng] B-37198
PATHOLOGY
Heavy metal accumulation and changes in southern minke whales [1987, eng] B-35312
Effects of feline panleucopaenia on Marion I.'s cat population [1987, eng] B-36153
PHYSIOLOGY
Amino acids in blood serum during digestion of krill protein [1985, rus] B-34730
Buffering capacity in marine and terrestrial vertebrate muscles [1981, eng] B-35013
Effects of krill as an emulsifier on rabbit metabolism [1986, eng] B-35048
Selective advantages of alien predators on Marion Island [1986, eng] B-35520
Cold-stable microtubules from antarctic fishes contain unique alpha tubulins [1987, eng] B-36183
Signs of adaptation to high altitude in albino rats [1986, rus] B-36236
Biological effects of natural and artificial antifreezes [1987, eng] B-37402
Distribution of heavy metals in antarctic marine ecosystem [1987, eng] B-37464
POPULATION
Control of Marion Island cat population [1986, eng] B-35519
Effects of feline panleucopaenia on Marion I.'s cat population [1987, eng] B-36153
Sightings of marine mammals during SIBEX-2 in Bransfield Strait and adjacent waters [1987, spa] B-37044
Netherlands South Georgia Scientific Expedition [1988, dut] D-37503

Mammalia-Cetacea
Whales in the antarctic ecosystem [1987, eng] B-35732
Data on the ecology of Commerson's dolphin from Kerguelen Islands [1987, fre] B-36787
BREEDING CYCLES AND REPRODUCTION
Earplug transition phase and sexual maturity in female minke whale [1986, eng] B-34763
EVOLUTION
History of whales in the Southern Hemisphere [1985, eng] B-37415
EXPLOITATION
Lengths and distribution of antarctic sei whales [1986, eng] B-34764
Distribution of the southern blue whale in relation to recent estimates of abundance [1986, eng] B-34766
Whales: regulations, harvesting and stocks [1987, rus] B-36283
Aerial survey of Maritime Western Australia southern right and humpback whales [1985, eng] B-37416
See also: Whaling
GEOGRAPHIC DISTRIBUTION
Lengths and distribution of antarctic sei whales [1986, eng] B-34764
Distribution of the southern blue whale in relation to recent estimates of abundance [1986, eng] B-34766
Right whale sightings around South Georgia [1987, eng] B-36216
Cetacean survey in eastern Tierra del Fuego and Isla de los Estados [1986, eng] B-36836
MORPHOLOGY
Earplug transition phase and sexual maturity in female minke whale [1986, eng] B-34763
Records of beaked whales (Ziphiidae) from the western South Atlantic [1986, eng] B-34765
Adaptive significance of size and pigmentation of an isolated population of the subantarctic dolphin *Cephalorhynchus commersonii* (Lacépède, 1804) [1986, fre] B-35240
New whale-fish species from the Lazarev Sea [1987, eng] B-36538
Cetacean survey in eastern Tierra del Fuego and Isla de los Estados [1986, eng] B-36836
NUTRITION
Summer diet of Commerson dolphin from Kerguelen Islands [1984, fre] B-34758
Feeding of seabirds and killer whales at Crozet Is. [1987, eng] B-36401
PATHOLOGY
Summer diet of Commerson dolphin from Kerguelen Islands [1984, fre] B-34758
Trace element content in two species of whale tapeworms [1986, eng] B-35321
Variations of organochlorine residues with age and sex in antarctic minke whale [1986, eng] B-35669
Heavy metal accumulation in minke whale liver [1986, eng] B-35670
Morphological variation of parasite of the genus *Pennella* Oken [1987, eng] B-36543
PHYSIOLOGY
Earplug transition phase and sexual maturity in female minke whale [1986, eng] B-34763
Adaptive significance of size and pigmentation of an isolated population of the subantarctic dolphin *Cephalorhynchus commersonii* (Lacépède, 1804) [1986, fre] B-35240
Heavy metal accumulation and changes in southern minke whales [1987, eng] B-35312
Variations of organochlorine residues with age and sex in antarctic minke whale [1986, eng] B-35669
Heavy metal accumulation in minke whale liver [1986, eng] B-35670
POPULATION
Distribution of the southern blue whale in relation to recent estimates of abundance [1986, eng] B-34766
Population assessment of minke whales during IWC/IDCR program [1986, spa] B-35267
Right whale sightings around South Georgia [1987, eng] B-36216
Whale sightings in the bays off Gerlache Strait [1988, eng] B-36976
Aerial survey of Maritime Western Australia southern right and humpback whales [1985, eng] B-37416
TAXONOMY
Records of beaked whales (Ziphiidae) from the western South Atlantic [1986, eng] B-34765
History of whales in the Southern Hemisphere [1985, eng] B-37415

GEOGRAPHIC DISTRIBUTION
South African and Australian fur seal [1985, eng] **B-37414**
MARKING
Juvenile survival and recruitment in a population of Weddell seals in McMurdo Sound [1987, eng] **B-37165**
Behavior and tagging of male southern elephant seals from the Vestfold Hills area [1985, eng] **B-37411**
MIGRATION
Behavior and tagging of male southern elephant seals from the Vestfold Hills area [1985, eng] **B-37411**
MORPHOLOGY
Examination of potential hearing damage in Weddell seals *(Leptonychotes weddelli)* in McMurdo Sound, Antarctica [1985, eng] **B-35385**
Facial asymmetry in a leopard seal *(Hydrurga leptonyx)* [1987, eng] **B-35767**
Histological, histochemical, and fine structural observations on the spleen of seals [1987, eng] **B-36800**
Skull morphometrics of male antarctic and subantarctic fur seals *Arctocephalus gazella* and *A. tropicalis,* and their interspecific hybrids [1987, eng] **B-37305**
Milk production and pup growth in Weddell seal at McMurdo Sound [1985, eng] **B-37413**
NUTRITION
Lactational energetics in Weddell seal suckling pups [1987, eng] **B-35879**
Assessment of competition between seals and commercial fisheries in the North Sea and the Antarctic [1988, eng] **B-37106**
Rearing of twin offspring to weaning in antarctic fur seals *Arctocephalus gazella* [1987, eng] **B-37304**
Size, status and demography of southern elephant seal *Mirounga leonina* populations [1985, eng] **B-37410**
PATHOLOGY
Ultrastructure of *Sarcocystis hydrurgae* from Leopard seal [1986, ger] **B-35291**
Examination of potential hearing damage in Weddell seals *(Leptonychotes weddelli)* in McMurdo Sound, Antarctica [1985, eng] **B-35385**
Facial asymmetry in a leopard seal *(Hydrurga leptonyx)* [1987, eng] **B-35767**
Tissue distribution of heavy metals in Weddell seals *(Leptonychotes weddellii)* [1987, eng] **B-36219**
Chlorinated hydrocarbons in adipose tissue of seals [1987, eng] **B-37174**
Six *Coccidiomorpha* n. sp. on seals from King George I. [1987, eng] **B-37254**
Aspects of ecology and biogeography of acanthocephala in antarctic seabirds [1986, eng] **B-37476**
PHYSIOLOGY
Pressure-volume characteristics of aortas in seals [1986, eng] **B-34707**
Hemoglobin concentrations and blood gas tensions of free-diving Weddell seals [1986, eng] **B-34815**
Microcomputer monitor and blood sampler for free-diving Weddell seals [1986, eng] **B-34816**
Balancing conflicting metabolic demands of exercise and diving [1986, eng] **B-35025**
Hypercapnia and hypoxia in Weddell seals ventilatory responses [1987, eng] **B-35463**
Reproductive bioenergetics of the antarctic fur seal, *Arctocephalus gazella.* [1985, eng] **B-35522**
Lactational energetics in Weddell seal suckling pups [1987, eng] **B-35879**
Weddell seal population dynamics in McMurdo Sound [1987, eng] **B-35894**
Diving adaptations of the Weddell Seal [1987, eng] **B-35983**
Tissue distribution of heavy metals in Weddell seals *(Leptonychotes weddellii)* [1987, eng] **B-36219**
Heart rate and body temperature during free diving of Weddell seals [1987, eng] **B-36426**
Histological, histochemical, and fine structural observations on the spleen of seals [1987, eng] **B-36800**
Growth from birth to 20 days in elephant seal [1987, eng] **B-37157**
Rearing of twin offspring to weaning in antarctic fur seals *Arctocephalus gazella* [1987, eng] **B-37304**
Seasonal breeding in male southern elephant seal at Macquarie I. [1985, eng] **B-37412**
Milk production and pup growth in Weddell seal at McMurdo Sound [1985, eng] **B-37413**

Longevity, fertility and philopatry of female southern elephant seals [1988, eng] **B-37500**

POPULATION

New methods for population studies in southern elephant seals *Mirounga leonina* [1986, spa] **B-35429**

Marine biological studies during the 25th JARE [1987, eng] **B-35744**

Weddell seal population dynamics in McMurdo Sound [1987, eng] **B-35894**

Status of elephant seal at Macquarie I. [1987, eng] **B-36560**

Annual and diurnal variations in the underwater vocalizations of Weddell seals [1988, eng] **B-36815**

Assessment of competition between seals and commercial fisheries in the North Sea and the Antarctic [1988, eng] **B-37106**

Population size and status of the southern elephant seal *(Mirounga leonina)* at South Georgia, 1951-1985 [1988, eng] **B-37128**

Juvenile survival and recruitment in a population of Weddell seals in McMurdo Sound [1987, eng] **B-37165**

Recolonization processes in the subantarctic fur seal *Arctocephalus tropicalis* on Amsterdam Island [1987, eng] **B-37307**

Antarctic seal life history patterns and the management of southern ocean resources [1987, eng] **B-37399**

Size, status and demography of southern elephant seal *Mirounga leonina* populations [1985, eng] **B-37410**

Research on coastal ice-free area during 26th JARE [1987, eng] **G-35745**

TAXONOMY

What shall we call the Weddell and Ross seals [1988, eng] **B-37107**

Skull morphometrics of male antarctic and subantarctic fur seals *Arctocephalus gazella* and *A. tropicalis,* and their interspecific hybrids [1987, eng] **B-37305**

South African and Australian fur seal [1985, eng] **B-37414**

Mantle studies

Isotope evidence of a mantle convection boundary at the Australian-Antarctic Discordance [1988, eng] **E-37517**

Anomalous heat flow near the Crozet Plateau and mantle convection [1986, eng] **L-34949**

Crustal structure in the Mizuho Plateau [1986, eng] **L-35036**

Gravity, crust and upper mantle in the antarctic region [1986, jpn] **L-35206**

Mantle rheology and satellite signatures from present-day glacial forcings [1988, eng] **L-36879**

Crust-mantle evaluation at Bouvet triple junction [1987, eng] **L-37344**

Antarctic AWS data, 1986 [1987, eng] **I-36335**
Ozone hole: ultraviolet radiation and ozone measurements in 1986-1987 [1987, spa] **I-36367**
Subsystem for meteorological, actinometric and aerological observations in the polar regions [1986, rus] **I-36427**
Characteristics of a semiautomatic method for actinometric measurements [1986, rus] **I-36430**
Duration of sunshine measured by actinograph [1986, rus] **I-36431**

Meteorology

INSTRUMENTS *(cont.)*

Instrument control method in computing radiation balance based on the law of probability [1986, rus] **I-36432**

Error evaluation for a scale transformer of measurements of radiation balance components [1986, rus] **I-36433**

Glaciological research program in east Queen Maud Land, East Antarctica, Part 6, Advance Camp, 1985 [1987, eng] **I-36573**

Meteorological observations at Showa Station, 1982 [1987, eng] **I-36578**

MAP observations at Syowa Station in 1985 [1987, eng] **I-36643**

Meteorological data from automatic weather stations near McMurdo [1983, eng] **I-36656**

Analysis of katabatic winds [1986, eng] **I-36665**

Lidar cloud studies at Showa Station [1986, eng] **I-36669**

Global trends in total ozone [1988, eng] **I-36682**

Solo flights into the ozone hole reveal its causes [1988, eng] **I-36875**

Atmospheric carbon dioxide problem [1987, eng] **I-37108**

Time dependent wind fields. Final report, Jan. 27, 1986 [1986, eng] **I-37308**

MAPS AND CHARTS

Microbial environment in Ross desert from satellite nanoclimate data, 1984-1986 [1987, eng] **B-36120**

Total ozone variations at Showa Station [1986, eng] **I-34953**

Recent measurements of antarctic ozone depletion [1986, eng] **I-34954**

Antarctic ozone change correlated to the stratospheric temperature field [1986, eng] **I-34955**

October temperature and total ozone trends, 1979-1985 [1986, eng] **I-34956**

Satellite measurements of total ozone [1986, eng] **I-34957**

Vertical ozone distribution in the antarctic ozone minimum measured by SBUV [1986, eng] **I-34958**

Morphology of antarctic total ozone as seen by TOMS [1986, eng] **I-34959**

Stratospheric cooling over Showa Station [1986, eng] **I-34960**

Planetary waves and spring ozone distribution [1986, eng] **I-34961**

Final warming and polar vortex disappearance during spring [1986, eng] **I-34962**

Final warming of the Southern Hemisphere stratosphere [1986, eng] **I-34963**

Ground observations of 1979-1985 ozone decline [1986, eng] **I-34964**

Total ozone decrease at South Pole, 1964-1985 [1986, eng] **I-34967**

Stratospheric ozone and aerosol measurements in spring 1985 [1986, eng] **I-34968**

SAM II measurements of antarctic PSC's and aerosols [1986, eng] **I-34974**

Satellite springtime measurements of ozone, nitrogen dioxide, and aerosols [1986, eng] **I-34975**

Preliminary calculation of trajectory analysis in the lower stratosphere of the Southern Hemisphere [1986, eng] **I-34983**

Atmospheric circulation monitoring in the Antarctic. Objectives, and ways of problem solving [1984, rus] **I-35071**

Energy estimation of atmospheric circulation over the southern ocean [1984, rus] **I-35072**

Low-level katabatic wind structure at Mizuho Station [1986, eng] **I-35098**

Global cloud field [1986, rus] **I-35205**

Weather and solar radiation measurements at Mount Takahe and Mount Murphy, West Antarctica [1985, eng] **I-35531**

Relationship between total ozone and stratospheric temperature [1986, eng] **I-35686**

Vertical distributions of atmospheric CF2Cl2, CFCl3 and N2O over Syowa Station in 1983 [1986, eng] **I-35687**

Polar anticyclone and circumpolar vortex seasonal and intra-seasonal fluctuations [1986, eng] **I-35689**

Surface windfield over the antarctic ice sheet [1987, eng] **I-35717**

Eddy dynamics and energetics of the Southern Hemisphere atmosphere in climatic scales [1986, rus] **I-35721**

Humidity of air in Antarctica [1986, eng] **I-35829**

Method for monthly charting of atmospheric precipitation [1986, eng] **I-35831**

Seasonal changes in pressure and temperature fields [1986, eng] **I-35843**

GCM study on the maintenance of the June 1982 blocking in the Southern Hemisphere [1987, eng] **I-35881**

Internal gravity wave in lower troposphere at Halley Station [1987, eng] **I-36116**

Endangered ozone layer [1987, eng] **I-36155**

Interaction between Antarctica and the atmospheric circulation near South America [1986, por] **I-36255**

Synoptic analyses on board the *Prof. W. Besnard* during Brazilian antarctic expeditions [1986, eng] **I-36257**

Meteorological observation on board the *Prof. W. Besnard* during Brazilian antarctic expeditions [1986, eng] **I-36258**

Ozone hole: ultraviolet radiation and ozone measurements in 1986-1987 [1987, spa] **I-36367**

Glaciological research program in east Queen Maud Land, East Antarctica, Part 6, Advance Camp, 1985 [1987, eng] **I-36573**

Meteorological observations at Showa Station, 1982 [1987, eng] **I-36578**

Ozone observation at Novolazarevskaya GDR Research Base, May-Dec. 1985 [1987, eng] **I-36645**

First International Conference on Southern Hemisphere Meteorology [1983, eng] **I-36652**

Traveling planetary waves and wave, mean-flow interactions [1983, eng] **I-36654**

Comparison of the quasi-stationary waves on the Northern and Southern hemispheres [1983, eng] **I-36655**

Meteorological data from automatic weather stations near McMurdo [1983, eng] **I-36656**

Mean geopotential fields for the lower thermosphere of the Southern Hemisphere [1986, eng] **I-36850**

Diagnostic analysis of two-dimensional monthly average ozone balance with Chapman chemistry [1986, eng] **I-36851**

Winter variation statistics of antarctic upper air meteorological parameters [1987, rus] **I-36927**

Mean geopotential distribution in the lower thermosphere of the Southern Hemisphere [1987, rus] **I-36929**

Meteorological forecasting for ecological monitoring in the western Atlantic sector of the Antarctic [1987, rus] **I-36932**

Atmospheric energetics in polar regions [1987, rus] **I-36950**

Weddell Sea synoptic weather, 1986 winter [1987, eng] **I-36985**

Predictability of planetary flow regimes: dynamics and statistics [1987, eng] **I-36987**

Antarctic climates [1987, eng] **I-36994**

Intensity of zonal and meridional atmospheric transfers in the Southern Hemisphere [1986, rus] **I-37029**

Principles of change of macro-synoptic processes of the Southern Hemisphere and weather characteristics in Antarctica [1986, rus] **I-37030**

Analysis of the 1000-300 hPa thickness field using satellite imagery [1985, eng] **I-37146**

Low humidity and transparency at Vostok Station [1986, eng] **I-37160**

Large-scale dynamics of the subantarctic atmosphere [1986, rus] **I-37230**

Biology, chemistry and sedimentology of the Kerguelen Plateau during Apsara 2 and Antiprod 3, Jan.-Feb. 1984 [1987, fre] **J-35221**

Oceanographic data of the 26th Japanese Antarctic Research Expedition from Nov. 1984 to Apr. 1985 [1987, eng] **J-35705**

Oceanographic data of the 27th Japanese Antarctic Research Expedition from Nov. 1985 to Apr. 1986 [1987, eng] **J-36581**

Optical methods of satellite hydrophysics. Environmental investigations from automatic satellites [1986, rus] **J-36902**

MODELS

Stochastic description of atmosphere-sea ice-ocean interaction [1986, eng] **F-35395**

Cryosphere—neglected component of the climate system [1987, eng] **F-36986**

Sea ice and the antarctic winter atmospheric circulation [1986, eng] **I-34782**

Climatic belts in the case of a unipolar glaciation [1984, eng] **I-34915**

Stratospheric cooling over Showa Station [1986, eng] **I-34960**

Chlorine chemistry in the stratosphere [1986, eng] **I-34978**

Simulation of ozone variations at high latitudes in Southern Hemisphere [1986, eng] **I-34981**

Preliminary calculation of trajectory analysis in the lower stratosphere of the Southern Hemisphere [1986, eng] **I-34983**

Antarctic ozone decreases: a dynamical cause? [1986, eng] **I-34984**

Large ozone losses in Antarctica: the role of heating perturbations [1986, eng] I-34985
Simulation of antarctic ozone with chemical and dynamical effects [1986, eng] I-34986
Antarctic ozone depletion: 2-D model studies [1986, eng] I-34987
Modelled stratospheric thermal response to ozone depletion [1986, eng] I-34988
Radiative heating due to stratospheric aerosols over Antarctica [1986, eng] I-34989
Stratospheric heating rates and diabatic circulation in spring [1986, eng] I-34990
Kinetics of the reaction ClO+ClO—>products and its relevance to ozone [1986, eng] I-34992
Kinetics study of the homogeneous and heterogeneous components of the HCl + ClONO2 reaction [1986, eng] I-34993
Southern Hemisphere blocking during the FGGE [1987, eng] I-35058
Stratospheric and mesospheric models of the Southern Hemisphere [1984, rus] I-35073
Mesospheric temperature fields and regional models of the atmosphere [1984, rus] I-35074
High-latitude structure of the temperature field in the mesopause-lower thermosphere region [1984, eng] I-35135
Global cloud field [1986, rus] I-35205
Comment on "Atmospheric boundary layer modification in the marginal ice zone" by T.J. Bennett, Jr. and K. Hunkins [1987, eng] I-35415
Quasi-geostrophic flow solution for the circulation over Antarctica [1986, eng] I-35485
Long-wave radiation sensitivity to atmospheric variations [1986, eng] I-35491
Real-time measurements of droplet size distribution in antarctic coastal clouds [1985, eng] I-35533
Chemistry of the global troposphere: fluorocarbons as tracers of air motion [1987, eng] I-35724
Autumn circulation restructuring of subantarctic stratosphere and mesosphere [1986, eng] I-35839
GCM study on the maintenance of the June 1982 blocking in the Southern Hemisphere [1987, eng] I-35881
Antarctic ozone depletion and heterogeneous photolysis [1987, eng] I-36052
Microstructure of antarctic coastal clouds [1984, eng] I-36054
Internal gravity wave in lower troposphere at Halley Station [1987, eng] I-36116
Katabatic winds in Adélie Land [1985, eng] I-36202
UV-B radiation increment due to stratospheric ozone depletion [1987, spa] I-36368
Uncertainty in ozone modification models [1987, eng] I-36411
Analytical model of the boundary layer above sloping terrain [1986, eng] I-36423
Method for measuring air temperature and evaluation of its reliability [1986, rus] I-36428
Results of methodology investigations by evaluation of subsystems for meteorological and actinometric observations [1986, rus] I-36429
Instrument control method in computing radiation balance based on the law of probability [1986, rus] I-36432
Error evaluation for a scale transformer of measurements of radiation balance components [1986, rus] I-36433
Actinometric data processing and prospects of its development on ES computers [1986, rus] I-36434
Algorithm for processing and control of hourly data in meteorological surveys [1986, rus] I-36435
Meteorological data processing and control flowchart [1986, rus] I-36436
Meteorological and actinometric data control subsystems [1986, rus] I-36437
Determination of variation limits in radiation balance components [1986, rus] I-36438
Automatic control structure of radiation balance components at Soviet stations [1986, rus] I-36439
Procedure for checking radiation-balance-component totals [1986, rus] I-36440
Automation of verification of actinometric instruments [1986, rus] I-36441
Carbon dioxide effects research and assessment program [1981, eng] I-36496
Impact of winds over the antarctic plateau on Southern Hemisphere circulations [1987, eng] I-36541
Circulation changes induced by the removal of antarctic sea ice in a July general circulation model [1986, eng] I-36661
Atmospheric GCM simulations of modern antarctic climate [1986, eng] I-36662
Interannual variations in a GCM in the Southern Hemisphere [1986, eng] I-36674
Sensitivity studies and a stratospheric ozone perturbation experiment [1987, eng] I-36803
Comment on 'Sea-ice and the antarctic winter circulation: a numerical experiment' by J.F.B. Mitchell and T.S. Hills (October 1986, 112, 953-969) [1987, eng] I-36811
Diagnostic analysis of two-dimensional monthly average ozone balance with Chapman chemistry [1986, eng] I-36851
Tides in the 80-100 km height region [1986, eng] I-36852
Model for estimating possible polar mesospheric cloud regions [1986, eng] I-36853
Simulation of gravity wave effects under solstice conditions using a 3-D circulation model of the middle atmosphere [1986, eng] I-36854
Global transport and inter-reservoir exchange of carbon dioxide [1986, eng] I-36883
Interannual variation of atmospheric CO2 concentration [1986, eng] I-36884
Winter variation statistics of antarctic upper air meteorological parameters [1987, rus] I-36927
Atmospheric energetics in polar regions [1987, rus] I-36950
Seasonal cycles of atmospheric water isotopes [1987, eng] I-36960
Predictability of planetary flow regimes: dynamics and statistics [1987, eng] I-36987
Analysis of the SBUV total ozone data [1988, eng] I-37009
Propagation of internal gravity waves in the stably stratified atmospheric boundary layer [1987, eng] I-37090
Ice-albedo feedback in a CO2-doubling situation [1987, eng] I-37103
Response of a general circulation model to a prescribed antarctic ozone hole [1988, eng] I-37287
Antarctic springtime ozone depletion computed from temperature observation [1988, eng] I-37329
Stratospheric response to trace gas perturbations [1988, eng] I-37387

Microbiology

Report on CSIC's activities [1987, spa] A-36485
Preliminary results of microbiological investigations at Mirnyy [1986, rus] B-34720
Influence of sea ice and sea ice biota on light in McMurdo Sound [1984, eng] B-34735
Photoadaptation of a colonial microalgal bloom in McMurdo Sound [1986, eng] B-34788
Cell division rates in algae of McMurdo Sound [1986, eng] B-34790
Microalgal carbon assimilation in sea ice of East Antarctica [1985, eng] B-34828
Lichen colonies in dry valley rocks [1983, ger] B-34844
Shallow-water foraminiferal ecology, Pacific Ocean [1980, eng] B-34847
Survival and water loss in some antarctic arthropods [1986, eng] B-34873
Pseudomonas genus of bacteria isolated from Antarctic ice sheets [1986, rus] B-34889
Redescription of the *Echinoderes pilosus* (Kinorhyncha: Cyclorhagida) [1986, eng] B-34891
Rapid micromethod for preparation of enzyme-antibody conjugates [1982, eng] B-35012
Composition and distribution of planktonic infusorians [1986, eng] B-35020
Determination of benthic rhizopod biomass using ATP analysis [1986, eng] B-35047
Lipids and blue-green algal mats in lakes [1986, eng] B-35063
Fatty acid composition and microbial activity in McMurdo Sound sediments [1986, eng] B-35122

Microbiology *(cont.)*

Unusual strain of *Desulfovibrio* sp. from an antarctic lake [1986, eng] **B-35123**

Culture methods and observations of *Corythion dubium* and *Euglypha rotunda* (Protozoa: Rhizopoda) isolated from maritime antarctic moss peats [1986, eng] **B-35287**

Changes of non-protein nitrogens fractions in krill during storage [1986, eng] **B-35290**

Phospholipids and carotenoids in cyanobacteria from different locations [1987, eng] **B-35320**

Photosynthate distribution by microplankton in permanently ice-covered antarctic desert lakes [1987, eng] **B-35325**

Ice nucleation activity of antarctic marine microorganisms [1985, eng] **B-35358**

Ecology of sea ice microbial communities of McMurdo Sound [1985, eng] **B-35359**

Lipid composition and microbial activity of selected recent antarctic benthic marine sediments and organisms: a mechanism for monitoring and comparing microbial populations [1985, eng] **B-35360**

Photoadaptive strategies in a natural population of *Phaeocystis pouchetii* in McMurdo Sound [1985, eng] **B-35361**

Ciliates and nanophytoplankton in Arthur Harbor, December 1984 and January 1985 [1985, eng] **B-35362**

Microheterotrophs in the ice-edge zone: an AMERIEZ study [1985, eng] **B-35363**

Trophic position of benthic rhizopods in McMurdo Sound [1985, eng] **B-35369**

Microorganism adaptation to high oxygen in oligotrophic lake [1984, eng] **B-35424**

Applied and environmental microbiology [1986, eng] **B-35427**

Sea ice microbial communities. 6. Growth and primary production in bottom ice under graded snow cover [1987, eng] **B-35443**

Bacterial production in annual sea ice in McMurdo Sound [1987, eng] **B-35445**

Environmental and photosynthetic relationships in antarctic sea ice algae [1987, eng] **B-35456**

Halomonas subglaciescola, a new species of halotolerant bacteria isolated from Antarctica [1987, eng] **B-35466**

DNA relatedness among aquatic yeasts *Metschnikowia* [1985, eng] **B-35467**

Field studies of antarctic cryptoendolithic microbial ecosystems, 1984-1985 [1985, eng] **B-35523**

Method for the continuous monitoring of snow: application to the cryptoendolithic microbial community of Antarctica [1985, eng] **B-35524**

Effects of light intensity on the cryptoendolithic microbiota [1985, eng] **B-35525**

Microorganisms in soil samples from Linnaeus Terrace, southern Victoria Land: preliminary observations [1985, eng] **B-35526**

Physiological groups of microorganisms in soils at Admiralty Bay [1986, eng] **B-35587**

Effect of growth temperature on esterase patterns in *Bacillus* species [1986, eng] **B-35592**

Biota and environment of the fumaroles on Mt. Melbourne [1987, eng] **B-35613**

Carbon flow in the pelagic zone of a lava-lakelet on Marion I. [1987, eng] **B-35614**

Ice diatom floras in Arthur Harbor [1987, eng] **B-35618**

Carbon, nitrogen and phosphorus in a desert moss community soil system [1986, eng] **B-35645**

Microbiology of human pollution at Showa Station [1985, jpn] **B-35650**

Extraction and measurements of adenosine triphosphate in water [1987, eng] **B-35716**

Antarctic terrestrial ecosystem [1987, eng] **B-35735**

Nitrogen in two contrasting antarctic bryophyte communities [1987, eng] **B-35761**

Study of heterotrophic microorganisms collected in Victoria Valley and Ross Island nearshore, Antarctica [1986, chi] **B-35884**

Catalogue of microorganism strains, 1987 [1987, eng] **B-35927**

Carbohydrate release during freeze-thaw at Signy Island [1987, eng] **B-36043**

ATP in rocks and biomass determination [1987, eng] **B-36110**

Pseudomonas bacteria from an antarctic glacial ice sheet [1987, eng] **B-36118**

Microbial environment in Ross desert from satellite nanoclimate data, 1984-1986 [1987, eng] **B-36120**

Effects of feline panleucopaenia on Marion I.'s cat population [1987, eng] **B-36153**

Bacteria and phytoplankton in Bransfield Strait and Drake Passage [1987, eng] **B-36210**

Winter primary productivity in sea ice, Antarctic Peninsula region [1987, eng] **B-36319**

Biogeochemical structure of the food web in the antarctic ocean [1987, eng] **B-36325**

Bacterial activity in soils of a subantarctic island [1987, eng] **B-36329**

Summer tide-crack phytoplankton in McMurdo Sound [1987, eng] **B-36331**

New bacterium isolated from marine environments [1987, eng] **B-36399**

Bacterioplankton of antarctic waters [1987, eng] **B-36535**

Bacterial cell size and biomass in Lake Vanda [1987, eng] **B-36576**

Distribution of *Microvibrio marinus* in Indian Ocean [1987, fre] **B-36688**

Coastal seawater bacteria and avifauna [1987, eng] **B-36698**

Preliminary characterization of organic soil under gramineae [1987, spa] **B-36727**

Temperature effect on bacteria in the Schirmacher Hills [1986, eng] **B-36750**

Nitrogen fixation in moss from East Ongul I. [1987, eng] **B-36771**

Humic substances resulting from decay of aquatic plants [1987, eng] **B-36772**

Seasonal dynamics of subantarctic marine heterotrophic microflora [1987, fre] **B-36786**

Europa, tidally heated oceans, and habitable zones around giant planets [1987, eng] **B-36855**

Reproductive biology of a common antarctic crinoid [1987, eng] **B-36866**

Differential temperature effects on the efficiency of carbon pathways in antarctic marine benthos [1987, eng] **B-36895**

Molecular aspects of adaptation to extreme cold environments [1986, eng] **B-36899**

Mollusca
New Trichotropidae gastropods from Kerguelen and Crozet Islands [1986, eng] **B-34753**
Kelp gull predation on limpet *Nacella delesserti* [1985, eng] **B-34832**
Squid beaks regurgitated by albatrosses on Prince Edward Is. [1986, eng] **B-35642**
Marine consumers: fish and squid [1987, eng] **B-35731**
Seasonal and annual diet variation in Macaroni and Rockhopper penguins at Marion I. [1987, eng] **B-35878**
Late Mesozoic bipolar bivalve faunas [1986, eng] **E-35624**
Upper Eocene La Meseta Formation, Seymour I. [1987, eng] **E-36260**
Australasian-Antarctic plate tectonics and Neogene brachiopods of New Zealand [1987, eng] **E-36798**
BEHAVIOR
Predation upon *Laternula elliptica* in South Bay [1986, eng] **B-34662**
EMBRYOLOGY
Genetic differentiation of two mussels from Kerguelen Islands [1987, eng] **B-34916**
EVOLUTION
Polar origins of marine invertebrate faunas [1986, eng] **E-36780**
EXPLOITATION
Discards from commercial fishing of krill found during the *Antártida 8611* cruise [1987, spa] **B-36379**
GEOGRAPHIC DISTRIBUTION
Growth and distribution of an antarctic squid [1985, eng] **B-34878**
Size, shape and distribution of organic matter in the Recent antarctic brachiopod *Liothyrella uva* [1987, eng] **B-35107**
New pleurobranch (Opisthobranchia: Notaspidae) [1987, eng] **B-35113**
Macroplankton zoogeography and community analysis [1987, ger] **B-35851**
Distribution of some antarctic nudibranchs (Opisthobranchia) [1987, eng] **B-36158**
Paleobiogeography of two decapod crustacean taxa [1986, eng] **B-36460**
Albian Megatrigoniinae and cretaceous bivalvia [1987, spa] **B-37133**
Progressive endemism in ammonite family Kossmaticeratidae after Gondwanaland breakup [1987, eng] **E-35810**
Late Mesozoic bivalve biogeography of Antarctica [1987, eng] **E-35811**
MIGRATION
Polar origins of marine invertebrate faunas [1986, eng] **E-36780**
MORPHOLOGY
Growth and distribution of an antarctic squid [1985, eng] **B-34878**
Size, shape and distribution of organic matter in the Recent antarctic brachiopod *Liothyrella uva* [1987, eng] **B-35107**
Tractolira germonae, a new abyssal antarctic volute [1987, eng] **B-35109**
New pleurobranch (Opisthobranchia: Notaspidae) [1987, eng] **B-35113**
New and rare cephalopods from the antarctic waters [1986, eng] **B-35666**
Seasonal variation in the diet of King penguins at Marion I. [1987, eng] **B-35880**
Redescription of *Aegires (Anaegires) albus* and synonymy with *A. protectus* [1987, eng] **B-36119**
Morphology of a fresh water molluscan of the Falkland Islands [1987, eng] **B-36206**
Cephalopod prey of the wandering albatross [1987, eng] **B-36864**
Albian Megatrigoniinae and cretaceous bivalvia [1987, spa] **B-37133**
Unusual occurrence of Upper Eocene nautilids on Seymour Island [1985, eng] **E-35180**
Identity of *Chonetes falklandicus* (Brachiopoda, Devonian) [1987, eng] **E-36953**
NUTRITION
Numerical taxonomy of bacterial communities associated with a subantarctic mussel bed [1987, eng] **B-37340**

PATHOLOGY
Parasite counts in a South Shetlands limpet [1986, ger] B-34879
Feeding of the foraminiferan *Cibicides refulgens* on scallop [1987, eng] B-36397
New species of parasite in finned octopod [1983, eng] B-36542
PHYSIOLOGY
Genetic differentiation of two mussels from Kerguelen Islands [1987, eng] B-34916
Brachiopod *Liothyrella uva* oxygen consumption and nitrogen excretion [1986, eng] B-35623
Distribution of heavy metals in antarctic marine ecosystem [1987, eng] B-37464
TAXONOMY
Growth and distribution of an antarctic squid [1985, eng] B-34878
Tractolira germonae, a new abyssal antarctic volute [1987, eng] B-35109
New pleurobranch (Opisthobranchia: Notaspidae) [1987, eng] B-35113
New and rare cephalopods from the antarctic waters [1986, eng] B-35666
Redescription of *Aegires (Anaegires) albus* and synonymy with *A. protectus* [1987, eng] B-36119
Cephalopod prey of the wandering albatross [1987, eng] B-36864
Albian Megatrigoniinae and cretaceous bivalvia [1987, spa] B-37133
Late Mesozoic bivalve biogeography of Antarctica [1987, eng] E-35811
Cretaceous palynomorphs from the Antarctic Peninsula [1987, eng] E-36838
Identity of *Chonetes falklandicus* (Brachiopoda, Devonian) [1987, eng] E-36953

Feeding and locomotory physiology of salps [1987, ger] **B-35857**

PHYSIOLOGY

Fatty acids and sterols of the tunicate *Salpa thompsoni* [1986, eng] **B-35607**

Feeding and locomotory physiology of salps [1987, ger] **B-35857**

TAXONOMY

Tunicates in Great Wall Bay [1987, chi] **B-37096**

Latitudinal variation in *Salpa thompsoni:* implications for *Salpa gerlachei* [1987, eng] **B-37459**

Protozoa

Culture methods and observations of *Corythion dubium* and *Euglypha rotunda* (Protozoa: Rhizopoda) isolated from maritime antarctic moss peats [1986, eng] **B-35287**

Microheterotrophs in the ice-edge zone: an AMERIEZ study [1985, eng] **B-35363**

Late Oligocene foraminifera in the MSSTS-1 core [1986, eng] **E-34805**

Late Cenozoic foraminifera in the MSSTS-1 core [1986, eng] **E-34806**

Biogenic siliceous particle flux in antarctic waters [1986, eng] **E-35250**

Cainozoic glacial marine sedimentation in McMurdo Sound drill hole [1986, eng] **E-35258**

Evidence for subpopulations in high-latitude foraminifera [1985, eng] **E-35339**

Early Miocene foraminiferal zonation, southeast Pacific basin, Antarctic [1987, eng] **E-36615**

Late Pliocene to Quaternary sedimentation on the South Orkney shelf [1987, eng] **E-36840**

Radiolaria from neogene sediments in the antarctic zone of the Pacific Ocean [1985, rus] **E-36962**

Major events in Neogene isotopic records [1986, eng] **F-35249**

Antarctic marine temperatures: late Campanian through early Paleocene [1987, eng] **J-35751**

BREEDING CYCLES AND REPRODUCTION

Ciliates and nanophytoplankton in Arthur Harbor, December 1984 and January 1985 [1985, eng] **B-35362**

ECOLOGY

Shallow-water foraminiferal ecology, Pacific Ocean [1980, eng] **B-34847**

Trophic position of benthic rhizopods in McMurdo Sound [1985, eng] **B-35369**

Effects of light intensity on the cryptoendolithic microbiota [1985, eng] **B-35525**

Benthic foraminifera in McMurdo Sound [1987, eng] **B-35760**

Archaeomonad (Chrysophyta) cysts: ecological and paleoecological significance [1986, eng] **B-36114**

Foraminiferal biotopes in Explorers Cove, McMurdo Sound, Antarctica [1987, eng] **B-36480**

Heliozoean genera *Pinaciophora* and *Acanthocystis* from Ellis Fjord [1987, eng] **B-36695**

Biogeography of testate rhizopods in the southern temperate and antarctic zones [1987, eng] **B-37355**

EVOLUTION

Archaeomonad (Chrysophyta) cysts: ecological and paleoecological significance [1986, eng] **B-36114**

Biogeography of testate rhizopods in the southern temperate and antarctic zones [1987, eng] **B-37355**

Evolution of the *Antarctissa* group [1986, eng] **E-34924**

GEOGRAPHIC DISTRIBUTION

Shallow-water foraminiferal ecology, Pacific Ocean [1980, eng] **B-34847**

Distribution of living benthic foraminifera, Isla de los Estados [1978, eng] **B-34848**

Composition and distribution of planktonic infusorians [1986, eng] **B-35020**

Determination of benthic rhizopod biomass using ATP analysis [1986, eng] **B-35047**

Archaeomonad (Chrysophyta) cysts: ecological and paleoecological significance [1986, eng] **B-36114**

Tintinnina in Bransfield Strait, 1983 [1986, eng] **B-36247**

Significance of infusoria in antarctic plankton communities [1987, eng] **B-37119**

Schackoinella antarctica, a new species of Foraminiferida (Glabratellidae) [1987, eng] **B-37195**

Biogeography of testate rhizopods in the southern temperate and antarctic zones [1987, eng] **B-37355**

Recent radiolarian genus *Antarctissa* from the Indian Ocean [1986, eng] **E-34925**

Contribution to sedimentary micropaleontology research in Antarctica [1987, spa] **E-36383**

Benthic foraminifera near the polar front, southwest Atlantic [1987, eng] **J-35452**

MORPHOLOGY

Feeding of the foraminiferan *Cibicides refulgens* on scallop [1987, eng] **B-36397**

Heliozoean genera *Pinaciophora* and *Acanthocystis* from Ellis Fjord [1987, eng] **B-36695**

Pinaciophora columna n. sp., *P. tasmanica* n. sp. and *P. apora* n. sp., new Heliozoeans from Australia, and a report of *P. fluviatilis* Greeff from Antarctica [1987, eng] **B-37031**

Protozoa in the microbial communities of maritime antarctic fellfields [1987, eng] **B-37366**

Evolution of the *Antarctissa* group [1986, eng] **E-34924**

Recent radiolarian genus *Antarctissa* from the Indian Ocean [1986, eng] **E-34925**

NUTRITION

Trophic position of benthic rhizopods in McMurdo Sound [1985, eng] **B-35369**

Feeding of the foraminiferan *Cibicides refulgens* on scallop [1987, eng] **B-36397**

Protozoa in the microbial communities of maritime antarctic fellfields [1987, eng] **B-37366**

PHYSIOLOGY

Ciliates and nanophytoplankton in Arthur Harbor, December 1984 and January 1985 [1985, eng] **B-35362**

Feeding of the foraminiferan *Cibicides refulgens* on scallop [1987, eng] **B-36397**

POPULATION

Distribution of living benthic foraminifera, Isla de los Estados [1978, eng] **B-34848**

Composition and distribution of planktonic infusorians [1986, eng] **B-35020**

Determination of benthic rhizopod biomass using ATP analysis [1986, eng] **B-35047**

Ciliates and nanophytoplankton in Arthur Harbor, December 1984 and January 1985 [1985, eng] **B-35362**

Tintinnina in Bransfield Strait, 1983 [1986, eng] **B-36247**

Foraminiferal biotopes in Explorers Cove, McMurdo Sound, Antarctica [1987, eng] **B-36480**

Species-poor testate rhizopod fauna on Brabant Island [1987, eng] **B-36848**

Significance of infusoria in antarctic plankton communities [1987, eng] **B-37119**

Dinoflagellates from water around South Georgia [1987, eng] **B-37155**

Protozoa in the microbial communities of maritime antarctic fellfields [1987, eng] **B-37366**

TAXONOMY

Benthic foraminifera in McMurdo Sound [1987, eng] **B-35760**

Tintinnina in Bransfield Strait, 1983 [1986, eng] **B-36247**

Pinaciophora columna n. sp., *P. tasmanica* n. sp. and *P. apora* n. sp., new Heliozoeans from Australia, and a report of *P. fluviatilis* Greeff from Antarctica [1987, eng] **B-37031**

Dinoflagellates from water around South Georgia [1987, eng] **B-37155**

Schackoinella antarctica, a new species of Foraminiferida (Glabratellidae) [1987, eng] **B-37195**

Evolution of the *Antarctissa* group [1986, eng] **E-34924**

Contribution to sedimentary micropaleontology research in Antarctica [1987, spa] **E-36383**

Psychology

Hygienic, architectural and psychological aspects of improved living conditions in Antarctica [1987, rus] **A-36949**

Walk to the Pole: to the heart of Antarctica in the footsteps of Scott [1987, eng] **A-36996**

Written personal narratives as research documents [1986, eng] **H-34792**

Health and performance of antarctic winter-over personnel [1986, eng] **H-34908**

Nervous disorders in Soviet wintering-over personnel [1984, rus] **H-35085**

Psychological effects of service in Antarctica [1987, eng] **H-35852**

Longitudinal study of personality and disease incidence among antarctic winter-over volunteers [1986, eng] **H-36021**

Psychology *(cont.)*
Long-term effects of environment on health and performance of antarctic winter-over personnel [1985, eng] **H-36022**
Sociocultural influences on psychosocial adjustment in Antarctica [1985, eng] **H-36023**

Research programs
Polar Research Board: Antarctic-related activities June 1984 to June 1985 [1985, eng] **A-35561**
Formulating the future [1987, eng] **A-36450**
Antarctic, Vol.11, No.5 [1987, eng] **A-36553**
Antarctica and space [1987, eng] **A-36893**
Terrestrial biology in Antarctica since the International Geophysical Year [1986, eng] **B-36833**
Biological productivity of antarctic waters [1987, eng] **B-37389**
Current problems in antarctic krill and zooplankton research [1987, eng] **B-37393**
Antarctic ice sheet studies: results and plans [1984, rus] **F-35078**
Arctic and Antarctic communications [1987, eng] **G-37026**
Antarctic climate research, No.1 [1986, eng] **I-34670**
Argentina
Argentine and Polish scientific cooperation in 1984-1986 [1986, eng] **A-35589**
Argentine museum in the Antarctic [1986, spa] **A-35873**
Science in Antarctica [1987, spa] **A-36531**
Argentine antarctic research programmes, 1987-1990 [1987, eng] **A-36734**
Bibiographic review of contributions on antarctic history presented at national historical congresses [1987, spa] **A-37131**
Argentine encyclopedic antarctic atlas [1984, spa] **C-35300**
Australia
Information exchange and modification of ANARE plans, 1986-87 and 1985-86 [1986, eng] **A-34871**
ANARE news, No.48 [1986, eng] **A-35294**
ANARE news no.49 [1987, eng] **A-36472**
ANARE news no.50 [1987, eng] **A-36473**
ANARE news no.51 [1987, eng] **A-36474**
Initial field reports, Australian ARP 1986-87 [1987, eng] **A-36562**
Australian National Museum of Antarctica [1987, eng] **A-36569**
Report of Australia's antarctic science program [1988, eng] **A-37408**
Benefits to Australia of a satellite data receiving station in Antarctica [1987, eng] **C-36810**
Project Blizzard 1985/86 [1986, eng] **D-34736**
Future of Mawson Institute in doubt [1986, eng] **G-34700**
Reception of satellite sensed data at Australian antarctic stations [1987, eng] **G-36809**
Australian upper atmospheric and space research, 1987 [1987, eng] **K-35955**
Australia's magnetospheric research in Antarctica [1987, eng] **K-35976**
AUSSAT beacon proposal—relevance to antarctic stations [1987, eng] **K-35977**
SUNDIAL campaigns [1987, eng] **K-35979**
Brazil
Boletim, No.11 [1987, por] **A-36735**
Boletim, No.9 [1986, por] **A-37199**
Boletim, No.10 [1987, por] **A-37202**
Boletim, No.12 [1987, por] **A-37206**
The Presidency: the only way [1987, por] **A-37207**
Brazil studies antarctic fauna [1986, por] **B-35417**
Brazilian Air Force in Antarctica [1987, por] **G-36736**
Canada
Some Canadians in the Antarctic [1986, eng] **D-35233**
Chile
Boletín antártico chileno, Vol.6, No.2 [1986, spa] **A-35307**
Chilean report No.29 to SCAR, 1987 [1987, spa] **A-36316**
Boletín antártico chileno, Vol.7, No.1 [1987, spa] **A-36420**
International scientific cooperation in Antarctica [1987, spa] **A-36421**
Boletín antártico chileno, Vol.7, No.2 [1988, spa] **A-37242**
Recovery of banded seabirds from South Shetland Is. [1987, spa] **B-37043**
Significance of the Coppermine Peninsula in a terrestrial ecology research program [1988, spa] **B-37243**
Antarctica: Chile's claim [1987, eng] **M-36395**
France
Far lands: the great polar adventure [1986, fre] **A-37185**
MD38/Apsara 2—Antiprod 3 on board the *Marion Dufresne* Jan. 16-Feb. 22, 1984 [1987, fre] **J-35220**
Biology, chemistry and sedimentology of the Kerguelen Plateau during Apsara 2 and Antiprod 3, Jan.-Feb. 1984 [1987, fre] **J-35221**
German Federal Republic
Research goals in Antarctica; international law, and general results of research [1986, ger] **A-34907**
Fisheries research in the Antarctic [1986, ger] **A-36584**
Germany's participation in SIBEX and CCAMLR [1986, eng] **B-34689**
Expedition ANTARKTIS-IV of RV *Polarstern* 1985/86. Report of Legs ANT-IV/3-4 [1987, ger] **D-37493**
India
Scientific report of the Third Indian Expedition to Antarctica [1986, eng] **D-36740**
International
Antarctic, Vol.11, No.1 [1986, eng] **A-34899**
International scientific coordination in Antarctica [1986, eng] **A-35146**
Antarctic science [1987, eng] **A-35626**
Geography, politics and science [1987, eng] **A-35627**
SCAR bulletin No.85, Jan. 1987 [1987, eng] **A-35714**
SCAR, the Antarctic Treaty and conservation [1987, eng] **A-35725**
Scientific opportunities in the Antarctic [1987, eng] **A-36137**
Second Spanish Symposium on Antarctic Studies, Madrid, July 13-15, 1987. Proceedings [1987, spa] **A-36355**
International scientific cooperation in Antarctica [1987, spa] **A-36421**
Report on CSIC's activities [1987, spa] **A-36485**
SCAR executive meeting of July 1987 [1987, eng] **A-36494**
19th SCAR meeting [1987, spa] **A-36526**
Laboratory Antarctica: research contributions to global problems [1987, eng] **A-36550**
Antarctic, Vol.11, No.2/3 [1986, eng] **A-36812**
Forum of antarctic scientists [1987, rus] **A-37078**
Far lands: the great polar adventure [1986, fre] **A-37185**

The Presidency: the only way [1987, por] **A-37207**
Germany's participation in SIBEX and CCAMLR [1986, eng] **B-34689**
BIOMASS newsletter, Vol.8(2) [1986, eng] **B-34869**
Report of the Meeting of the SCAR Group of Specialists on Seals, San Diego, California, June 11-13, 1986 [1987, eng] **B-35028**
Population assessment of minke whales during IWC/IDCR program [1986, spa] **B-35267**
BIOMASS [1987, eng] **B-35729**
BIOMASS workshop on krill physiology, 1986 [1987, eng] **B-36037**
Meeting of BIOMASS Data Centre Advisory Group, Bremerhaven, F.R.G., 28-30 October 1986 [1987, eng] **B-36038**
Meeting of the BIOMASS Executive, Paris, France, June 1, 1987 [1987, eng] **B-36131**
BIOMASS newsletter, Vol.9(1) [1987, eng] **B-36344**
BIOMASS newsletter, Vol.9(2) [1987, eng] **B-37032**
Post-SIBEX fish data evaluation workshop: Phase 1. Validation, Cambridge, U.K., 6-17 Oct. 1986 [1987, eng] **B-37047**
BIOMASS Data Analysis Workshop on Antarctic Phytoplankton/Zooplankton Relationships [1988, eng] **B-37379**
Atlas of the polar regions [1985, eng] **C-35306**
Circum-Pacific Map Project [1985, eng] **C-35566**
POLEX South Expedition, 1984 [1986, rus] **D-35947**
In Scotia Sea [1987, rus] **D-36475**
Southern ocean drilling: the South Atlantic and Indian Ocean sectors [1987, eng] **E-35776**
Joint U.K.-U.S. west antarctic tectonic project: an introduction [1987, eng] **E-35788**
Geological investigations in northern Victoria Land [1986, eng] **E-35901**
International antarctic glaciological program activities at South Pole Station and Vostok [1985, eng] **F-35200**
Soviet-American expedition "Weddell-POLEX-81", review [1986, rus] **F-35934**
Antarctic cornucopia [1987, eng] **F-36406**
Ice core links CO2 to climate [1987, eng] **F-36407**
International co-ordination of antarctic medical research and medicine [1987, eng] **H-37163**
Quadrennial Ozone Symposium, Greece, 1984 [1985, eng] **I-34942**
Ozone in Antarctica [1986, spa] **I-35311**
Expedition faces antarctic ozone hole mysteries [1987, eng] **I-36302**
Heat is on [1987, eng] **I-36303**
MAP observations at Syowa Station in 1985 [1987, eng] **I-36643**
Solo flights into the ozone hole reveal its causes [1988, eng] **I-36875**
Complex mission set to probe origins of antarctic ozone hole [1987, eng] **I-36973**
NASA's program for antarctic ozone research [1988, spa] **I-37244**
MD38/Apsara 2—Antiprod 3 on board the *Marion Dufresne* Jan. 16-Feb. 22, 1984 [1987, fre] **J-35220**
Biology, chemistry and sedimentology of the Kerguelen Plateau during Apsara 2 and Antiprod 3, Jan.-Feb. 1984 [1987, fre] **J-35221**
Soviet-American field experiment "Weddell-POLEX-81" [1986, rus] **J-35932**
Thermohaline water stratification in the southern ocean from ice cover data [1986, rus] **J-35933**
Prydz Bay oceanographic data, Jan.-Mar. 1981 [1987, eng] **J-36468**
Oceanographic data Prydz Bay Nov.-Dec. 1982 [1987, eng] **J-36471**
Role of the Antarctic in international upper atmosphere programs [1987, eng] **K-35972**
Australia's magnetospheric research in Antarctica [1987, eng] **K-35976**
Geomagnetically conjugate phenomena since the IGY [1987, eng] **K-36630**
Electrodynamics and magnetohydrodynamics of geospace [1987, eng] **K-36641**
Science, the Antarctic Treaty, and international politics [1987, eng] **M-35631**
Handbook of the Antarctic Treaty System [1987, eng] **M-36546**

Italy
First expedition of the Italian Antarctic Research Program: geomorphological observations [1986, ita] **E-36580**

Japan
Japanese antarctic activities, 1986 [1987, eng] **A-36024**
Japanese antarctic activities for 1986-1987 [1987, eng] **A-36025**
Activities of the 26th JARE wintering party [1986, jpn] **A-36720**
Summer party activities of the 27th JARE, 1985-1986 [1987, jpn] **A-37482**
Marine biological studies during the 25th JARE [1987, eng] **B-35744**
Penguins, seals and seabirds near Showa Station in 1985 [1987, eng] **B-35746**
Activities of the wintering party of the 26th JARE [1987, eng] **D-35743**
Research on coastal ice-free area during 26th JARE [1987, eng] **G-35745**

New Zealand
New Zealand antarctic research programme 1986-87 [1986, eng] **A-36523**
New Zealand antarctic research programme 1987-88 [1986, eng] **A-36524**
Antarctic Cenozoic history from the MSSTS-1 drillhole, McMurdo Sound [1986, eng] **E-34800**

Norway
Yearbook of the Norwegian Polar Research Institute, 1985 [1985, eng] **A-35313**
Yearbook of the Norwegian Polar Research Institute, 1986 [1987, eng] **A-36558**

Peru
Peru and the antarctic question [1986, spa] **M-36479**

Poland
Third antarctic expedition of Polish biologists, 1973-1974 [1974, pol] **A-35053**
Argentine and Polish scientific cooperation in 1984-1986 [1986, eng] **A-35589**

South Africa
South African experience in antarctic atmospheric physics research [1987, eng] **K-37197**

Spain
Second Spanish Symposium on Antarctic Studies, Madrid, July 13-15, 1987. Proceedings [1987, spa] **A-36355**
Possible role of Spain in the protection of Antarctica [1987, spa] **A-36390**
Report on CSIC's activities [1987, spa] **A-36485**
Oceanographic research vessel of 2,700 tons [1987, spa] **G-36391**

United Kingdom
SPRI 60th annual report [1986, eng] **A-35868**
Joint Services Expedition to Brabant Island, Antarctica, 1984/85 [1987, eng] **D-35772**
Joint Services Expedition to Brabant Island: overwintering in tents in Antarctica [1986, eng] **D-37492**
Tectonics of West Antarctica and its relation to East Antarctica: USARP-BAS geology/geophysics project (1984-1985) [1985, eng] **E-35177**
Britain's antarctic dimension [1983, eng] **M-35236**

United States
South light: a journey to the last continent [1985, eng] **A-34734**
U.S. report to SCAR, No.28 [1986, eng] **A-34749**
U.S. antarctic research in the 21st century [1986, eng] **A-34757**
Antarctic awakening [1986, eng] **A-34905**
Antarctic journal of the United States, Vol.21, No.3 [1986, eng] **A-35117**
Polar research [1987, eng] **A-35847**
Role of the National Science Foundation in polar regions [1987, eng] **A-36487**
Survey's polar meeting was triple anniversary [1984, eng] **A-36540**
United States report to SCAR, No.29 [1987, eng] **A-36557**
Annual report 1986 and future plans [1987, eng] **A-36568**
Antarctic journal of the United States, Vol.21, No.4 [1986, eng] **A-36832**
Frozen in place: American policy and practice in Antarctica [1986, eng] **A-36975**
Why U.S. needs polar research vessels [1987, eng] **A-37023**
Polar Research Board annual report 1987 and future plans [1988, eng] **A-37511**
Pelagic shrimp of the family Oplophoridae from Pacific southern ocean [1986, eng] **B-34798**
Mapping activities in Antarctica [1985, eng] **C-35567**
High latitude drilling in the ocean drilling program [1986, eng] **E-34677**

Research programs
United States (cont.)
Ocean Drilling Program after 1 year of drilling operations [1986, eng] **E-35024**
Tectonics of West Antarctica and its relation to East Antarctica: USARP-BAS geology/geophysics project (1984-1985) [1985, eng] **E-35177**
U.S. earth sciences antarctic research plans [1921, eng] **E-35214**
Recommendations for a U.S. ice coring program [1986, eng] **F-34741**
Aircraft support of research in Antarctica [1986, eng] **G-34997**
Antarctic support operations [1985, eng] **G-35572**
Zero Base II analysis [1973, eng] **G-36419**
Causes and effects of a hole [1987, eng] **I-35126**
Ozone in Antarctica [1986, spa] **I-35311**
Depletion of ozone layer above Antarctica [1986, eng] **I-35877**
Watch this space [1987, eng] **I-35885**
Solo flights into the ozone hole reveal its causes [1988, eng] **I-36875**
United States' national ozone expedition statement [1987, eng] **I-37033**
Astronomy on ice [1986, eng] **K-36327**
1985-1986 South Pole balloon campaign [1987, eng] **K-36650**
Uruguay
Actividad cientffica, 1985/86, Vol.1 [1987, spa] **A-35886**
Antarctic Treaty. Uruguay's activities [1987, spa] **A-36567**
Meteorological investigations in Antarctica [1987, spa] **I-35887**
USSR
Soviet expeditions to Antarctica [1984, eng] **A-35398**
What does the antarctic map say [1987, rus] **A-36129**
Antarctic. Committee reports No.11 [1974, eng] **A-36525**
Report on the 25th Soviet Antarctic Expedition [1984, rus] **A-36998**
Winter operations of the 26th Soviet Antarctic Expedition [1987, rus] **A-37065**
Complex investigations of the All-Union Institute of Fisheries and Oceanography on fishing resources in the world ocean. Collection of papers [1987, rus] **B-37220**
Soviet study areas on fishing resources in the world ocean [1987, rus] **B-37221**
Report on thc 24th Soviet Antarctic Expedition [1986, rus] **D-34714**
Seasonal activity and scientific observations in the 27th Soviet Antarctic Expedition [1986, rus] **D-35931**
POLEX South Expedition, 1984 [1986, rus] **D-35947**
Report of the 24th Soviet Antarctic Expedition [1986, rus] **D-36194**
Report of the 23rd Soviet Antarctic Expedition [1986, rus] **D-36228**
Attraction of the poles [1987, rus] **D-36463**
Expedition on board *Admiral Vladimirskiy* and *Faddei Bellingshausen*, 1982-1983 [1987, rus] **D-37075**
Geology of the Antarctic [1987, eng] **E-36453**
Glacioclimatolgical research [1986, eng] **F-35828**
Main results of meteorological studies [1986, eng] **I-35815**
Information automation system in multiple marine expeditions [1986, rus] **I-36442**
Research vessels
Soviet expeditions to Antarctica [1984, eng] **A-35398**
Seasonal activity and scientific observations in the 27th Soviet Antarctic Expedition [1986, rus] **D-35931**
Ship for scientific expeditions to Antarctica [1987, rus] **G-35900**
Oceanographic research vessel of 2,700 tons [1987, spa] **G-36391**
Rauma-Repola in the Antarctic [1987, eng] **G-36802**
Information automation system in multiple marine expeditions [1986, rus] **I-36442**
See also: Ships
Admiral Vladimirskiy
Expedition on board *Admiral Vladimirskiy* and *Faddei Bellingshausen*, 1982-1983 [1987, rus] **D-37075**
Akademik Fedorov
New Soviet Antarctic research ship *Akademik Fedorov* [1987, eng] **G-37180**
Faddei Bellingshausen
Expedition on board *Admiral Vladimirskiy* and *Faddei Bellingshausen*, 1982-1983 [1987, rus] **D-37075**
Marion Dufresne
MD38/Apsara 2—Antiprod 3 on board the *Marion Dufresne* Jan. 16-Feb. 22, 1984 [1987, fre] **J-35220**
Mikhail Somov
Ice conditions in the "Weddell-POLEX-81" study arrea [1986, rus] **F-35935**
Soviet-American field experiment "Weddell-POLEX-81" [1986, rus] **J-35932**
Polarstern
Germany's participation in SIBEX and CCAMLR [1986, eng] **B-34689**
Professor Vize
POLEX South Expedition, 1984 [1986, rus] **D-35947**
Shirase
Japanese antarctic activities, 1986 [1987, eng] **A-36024**
Japanese antarctic activities for 1986-1987 [1987, eng] **A-36025**
Shirase and icebreaking ship technology in Japan [1987, eng] **G-37178**
Walther Herwig
Germany's participation in SIBEX and CCAMLR [1986, eng] **B-34689**
Reviews
Antártida Argentina, No.24 [1986, spa] **A-35389**
Nordenskjold, Larsen and Sobral in Antarctica again [1986, spa] **A-35635**
Forum of antarctic scientists [1987, rus] **A-37078**
Maritime fur trade: sealers and other residents on St. Paul and Amsterdam islands. Pts. 1 and 2 [1984, eng] **A-37489**
Fish productivity in the atlantic neritic zone [1986, rus] **B-34680**
Whales: regulations, harvesting and stocks [1987, rus] **B-36283**
Seal resources on antarctic ice [1987, rus] **B-36284**
Biological productivity of antarctic waters [1987, eng] **B-37389**
Some Canadians in the Antarctic [1986, eng] **D-35233**
Cenozoic stratigraphy of the southern ocean [1986, rus] **E-34679**
Gondwanian orogeny within the Antarctic Peninsula: a discussion [1987, eng] **E-35797**
Moon [1987, eng] **E-36892**
Soviet-American expedition "Weddell-POLEX-81", review [1986, rus] **F-35934**
Ice core links CO2 to climate [1987, eng] **F-36407**
Main results of meteorological studies [1986, eng] **I-35815**
Ice calving, carbon dioxide and control of ice ages [1985, eng] **I-36012**
Late Quaternary deep-ocean circulation [1986, eng] **J-34685**
Polar oceans [1987, eng] **J-36891**
Modelling the southern ocean circulation [1987, rus] **J-37375**
Geomagnetically conjugate phenomena since the IGY [1987, eng] **K-36630**
Rock magnetism
See: Magnetism/Rock
Rockets
Attitude detection by horizon aspect sensor on rockets [1987, eng] **G-36057**
Report on the MT-135JA meteorological rocket experiment (JARE-26) [1986, jpn] **I-35210**
Observations of auroral LHR noise by the sounding rocket S-310JA-6 [1987, eng] **K-35606**
Ninth symposium on ionospheric research, Tokyo, 1986 [1987, eng] **K-36055**
Showa Station rocketsonde experiment with aurora [1987, eng] **K-36056**
Rocket shooting into aurora australis in 1984 [1985, jpn] **K-36622**
Rocket sounding of the auroral magnetic field [1988, eng] **K-37430**
Attitude determination of the antarctic sounding rockets S-310JA-11 and -12 [1988, eng] **K-37431**
Electron density in the auroral atmosphere [1988, eng] **K-37432**
Preliminary analysis of electron density and electric field fluctuations [1988, eng] **K-37433**
Height variations of auroral hiss observed by S-310JA-11 and -12 rockets [1988, eng] **K-37434**
Modulations of low energy electron flux in the ionosphere [1988, eng] **K-37435**
Rotation
See under: Earth
Runoff
See: Meltwater
Runways
See: Airfields; Construction/Runway
Safety procedures
Helicopter operations and safety guide [1986, eng] **G-34724**

Air/ground transportation in Antarctic logistics support [1986, eng] G-34996
Guide for extreme cold weather operations [1986, eng] G-35111
Antarctic field manual [1986, eng] G-36520
New Zealand antarctic field manual [1987, eng] G-36814
Epidemiology in Antarctica? [1986, eng] H-35050
Health and safety during Spanish expedition [1987, spa] H-36389
See also: Fire protection; Survival

Salinity
See under: Sea water

Sanitation
Health and safety during Spanish expedition [1987, spa] H-36389
See also: Hygiene; Waste disposal

Satellites (artificial)
ARAMIS remote sensing system [1987, eng] A-36212
Antarctica and space [1987, eng] A-36893
Ornithological investigations at Palmer Station: the first long-distance tracking of seabirds by satellites [1985, eng] B-35378
Microbial environment in Ross desert from satellite nanoclimate data, 1984-1986 [1987, eng] B-36120
Drake Passage/Western Scotia Sea [1986, eng] B-37252
Antarctic ice sheet configuration 30 deg E to 80 deg E [1986, eng] C-34769
Methods of compiling general radar maps of polar regions [1986, rus] C-35216
Landsat multispectral images of Antarctica applied to mapping and glaciology [1985, eng] C-35568
Contemporary methods in antarctic cartography [1986, rus] C-35632
Airborne observations of terrestrial surfaces [1986, eng] C-35850
Express analysis of satellite radar images of sea ice [1987, eng] C-36486
Benefits to Australia of a satellite data receiving station in Antarctica [1987, eng] C-36810
Macro and meso-structures on the surface of the antarctic ice sheet from satellite radar images [1987, rus] C-37148
SCAR bulletin No.88, January 1988 [1988, eng] E-36980
Weddell-Scotia sea ice margin, Oct. 1984 [1986, eng] F-34750
Glacio-geophysical implications of NNSS positioning at Showa Station [1986, eng] F-35040
Observing the polar regions from space [1984, eng] F-35066
Surface topography of large ice masses from Landsat imagery [1987, eng] F-35652
Giant tabular iceberg data from satellite [1987, eng] F-35713
Coastline changes revealed by satellite imagery [1987, eng] F-35774
Ice sheet topography and internal characteristics, Greenland and Antarctica [1986, eng] F-35849
Ice sheet altimetry in the Antarctic and Greenland [1981, eng] F-35920
Shuttle Imaging Radar B Weddell Sea ice observations [1987, eng] F-36008
Ground and satellite measurement of ice sheets, Queen Maud Land [1987, eng] F-36071
On the draughts of some large antarctic icebergs [1987, eng] F-36464
Satellite observations of polar ice fields [1983, eng] F-36794
Technology in the advancement of glaciology [1987, eng] F-36968
Satellite communications for antarctic science [1985, eng] G-35571
Wind hybrid power system for antarctic Inmarsat link [1986, eng] G-35636
Antarctic communication [1987, eng] G-36299
Wind power in Antarctica [1987, eng] G-36583
Satellite communication—INMARSAT terminal [1986, eng] G-36761
Reception of satellite sensed data at Australian antarctic stations [1987, eng] G-36809
Arctic and Antarctic communications [1987, eng] G-37026
Operation and maintenance of the McMurdo geodetic observatory [1987, eng] G-37046
Structure of medium-scale atmospheric waves in the Southern Hemisphere summer [1983, eng] I-34725
Ozone interannual variability during circumpolar vortex breakdown [1986, eng] I-34952
Satellite measurements of total ozone [1986, eng] I-34957
Vertical ozone distribution in the antarctic ozone minimum measured by SBUV [1986, eng] I-34958
Morphology of antarctic total ozone as seen by TOMS [1986, eng] I-34959
Planetary waves and spring ozone distribution [1986, eng] I-34961
Polar stratospheric clouds inferred from satellite data [1986, eng] I-34969
Dynamic and chemically controlled variations of stratospheric NO2 and O3 [1986, eng] I-34970
SAM II measurements of antarctic PSC's and aerosols [1986, eng] I-34974
Satellite springtime measurements of ozone, nitrogen dioxide, and aerosols [1986, eng] I-34975
Seven years of total ozone from the TOMS instrument: a report on data quality [1986, eng] I-34994
Assessment of SBUV total ozone data in comparison to Dobson data [1986, eng] I-34995
Global cloud field [1986, rus] I-35205
Middle atmosphere water vapor [1986, eng] I-35319
Lee vortices in the Antarctic [1986, eng] I-35486
Global ozone transport related to planetary waves [1987, eng] I-35579
Antarctic climate and space research [1987, eng] I-35630
Cloud fields over Antarctica from satellite data [1986, eng] I-35830
Cloud motion over Antarctica [1986, eng] I-35845
Identification of clouds over Antarctica from satellite imagery [1987, ger] I-36189
Characteristics of the antarctic ozone hole derived from Nimbus 7 TOMS data [1987, eng] I-36591
Characteristics of intense antarctic depressions near the Drake Passage. [1983, eng] I-36657
Analysis of the 1000-300 hPa thickness field using satellite imagery [1985, eng] I-37146
Global changes in ozone from satellite observations, 1970-1986 [1988, eng] I-37217
Time dependent wind fields. Final report, Jan. 27, 1986 [1986, eng] I-37308
Oceanographic and geophysical applications of satellite altimetry [1987, eng] J-36582
Optical methods of satellite hydrophysics. Environmental investigations from automatic satellites [1986, rus] J-36902
Poleward edge of the mid-latitude electron density trough [1986, eng] K-34710
Polar aurora from Salyut-6 during geomagnetic storm, Apr. 11-13, 1981 [1985, eng] K-35137
Correlated electron and X ray measurements of quiet time electron precipitation: a comparative study of bremsstrahlung production and transport in the atmosphere [1986, eng] K-35405
New type of VLF emission from Siple Station [1985, eng] K-35557
On the conjugacy of the aurora: high and low latitudes [1987, eng] K-35952
Ionospheric irregularities around L=4 using satellite beacons [1987, eng] K-35971
AUSSAT beacon proposal—relevance to antarctic stations [1987, eng] K-35977
Narrow-banded ELF emissions over the southern polar region [1987, eng] K-36221
Magnetic conjugacy as observed at the apex of field lines: Geos-1 and -2 results [1987, eng] K-36635
Magnetic field measurements in the ionosphere-magnetosphere region [1986, eng] K-36898
Low-altitude observations of the conjugate polar cusps [1988, eng] K-37010
Whistler emissions at low altitudes over Antarctica [1988, eng] K-37445
Satellite observation of medium-scale traveling ionospheric disturbances over Syowa Station [1988, eng] K-37446
Ionospheric disturbance effect on NNSS satellite positionings at Syowa Station [1988, eng] K-37447
Satellite magnetic anomalies and continental reconstructions [1987, eng] L-35780

Snow
Science in Antarctica, Vol.9: Data compilation [1985, jpn] A-34909
JARE-27 field report, Sör Rondane Mountains, 1986 [1986, jpn] E-35211
Snow load effect on the Earth's rotation and gravitational field, 1979-1985 [1987, eng] F-36351
Materials for the World Atlas of Snow and Ice Resources [1988, eng] F-37272
Meteorological observation on board the *Prof. W. Besnard* during Brazilian antarctic expeditions [1986, eng] I-36258
Report on the Polar Panel [1981, eng] I-36497
Hydrometeorological regime of the southern ocean in summer 1982-1983 [1987, rus] I-37074
ACCUMULATION
Microbial environment in Ross desert from satellite nanoclimate data, 1984-1986 [1987, eng] B-36120
Pb-210 measurement of snow accumulation at Mizuho Station [1986, eng] F-34781
Nitrate deposition in Antarctica; temporal and spatial variations [1986, eng] F-35469
JARE-26 glaciological research, 1984-1986 [1987, eng] F-35704
Riiser-Larsen oxygen isotopes and accumulation rates [1986, eng] F-35872
Accumulation distribution in Adélie Coast and meteorological parameters [1986, eng] F-36034
Study of Dakshin Gangotri ice-shelf [1986, eng] F-36759
Accumulation and temperature of the James Ross I. ice cover [1987, eng] F-36910
Study of long period average accumulation of atmospheric precipitation in the Mirnyy Station area [1987, rus] F-37069
Method for monthly charting of atmospheric precipitation [1986, eng] I-35831
Glaciological research program in east Queen Maud Land, East Antarctica, Part 6, Advance Camp, 1985 [1987, eng] I-36573
Meteorological observations at Showa Station, 1982 [1987, eng] I-36578
AGE DETERMINATION
Stress-strain relation for dry snow in Greenland and Antarctica [1987, eng] F-36911
CHEMISTRY
Nitrogen in two contrasting antarctic bryophyte communities [1987, eng] B-35761
Pb-210 measurement of snow accumulation at Mizuho Station [1986, eng] F-34781
Antarctic precipitation chemistry [1986, eng] F-34892

Snow
CHEMISTRY *(cont.)*
Nitrate flux on the Ross Ice Shelf and its relation to solar cosmic rays [1986, eng] **F-34971**
Morphological and chemical data on microparticles in antarctic snows [1986, eng] **F-35103**
Nitrate variability in South Pole and Ross Ice Shelf snow and firn [1985, eng] **F-35196**
Ice core study of antarctic climatic history [1985, eng] **F-35198**
Nitrate deposition in Antarctica; temporal and spatial variations [1986, eng] **F-35469**
Trace elements in surface snow near Showa Station [1986, eng] **F-35692**
Anthropogenic and natural lead in antarctic snow [1987, eng] **F-36163**
New types of spherules from Antarctica: meteoritic impact origin? [1987, eng] **F-37097**
Glaciology and chemistry of snow in eastern Queen Maud Land [1987, eng] **F-37479**
Nitrate trace determinations in snow and firn cores from Weddell Sea [1988, eng] **F-37496**
Stratospheric and tropospheric sources for nitrate in antarctic snow [1986, eng] **I-34857**
Airborne measurements of the antarctic cloud water acidity [1985, eng] **I-35534**
Air pollution and natural atmospheric sedimentation over Admiralty Bay [1987, eng] **I-37169**
COMPACTION
Casey snow runway data report, 1983-84 [1984, eng] **F-36081**
Casey snow runway tests, 1983-84 [1984, eng] **F-36082**
Development of methodology for design of snow roads and airstrips [1986, eng] **F-36873**
Densification of snow/firn in the surface layer, antarctic ice sheet [1987, chi] **F-37328**
Casey snow runway meteorological records, 1984 [1987, eng] **I-36083**
CORES
Nitrate trace determinations in snow and firn cores from Weddell Sea [1988, eng] **F-37496**
CRYSTALS
Morphology of bullet-type snow crystals at Showa Station [1986, eng] **F-35691**
DEFORMATION
Collapse prediction analysis of the South Pole dome [1988, eng] **G-37325**
DENSITY
Riiser-Larsen's absolute movements, mass balance and snow temperature [1986, eng] **F-35871**
Casey snow runway tests, 1983-84 [1984, eng] **F-36082**
Stress-strain relation for dry snow in Greenland and Antarctica [1987, eng] **F-36911**
Antarctic field tests on SARSAT personal locater beacons [1987, eng] **G-36868**
Casey snow runway meteorological records, 1984 [1987, eng] **I-36083**
DISTRIBUTION
Airborne observations of terrestrial surfaces [1986, eng] **C-35850**
Atmospheric circulation of the Northern Hemisphere and Antarctic ice-snow cover [1987, eng] **F-36311**
Densification of snow/firn in the surface layer, antarctic ice sheet [1987, chi] **F-37328**
DRIFTING
Initiation condition of drifting snow [1987, jpn] **F-37488**
Katabatic winds in Adélie Land [1985, eng] **I-36202**
ELECTRICAL PROPERTIES
Vertical radar sounding of the antarctic layered snow [1985, rus] **F-37027**
HEAT EXCHANGE
Glaciological research program in east Queen Maud Land, East Antarctica, Part 6, Advance Camp, 1985 [1987, eng] **I-36573**
INSTRUMENTS
Method for the continuous monitoring of snow: application to the cryptoendolithic microbial community of Antarctica [1985, eng] **B-35524**
MAPS AND CHARTS
Snow algal bloom and habitat at Showa Station [1986, eng] **B-35671**
Accumulation distribution in Adélie Coast and meteorological parameters [1986, eng] **F-36034**
MECHANICAL PROPERTIES
Deformation of snow and ice at German antarctic stations [1984, ger] **F-34727**
Snow and ice features shown by thematic mapper and MSS images [1987, eng] **F-36073**
Glaciology and chemistry of snow in eastern Queen Maud Land [1987, eng] **F-37479**
Initiation condition of drifting snow [1987, jpn] **F-37488**
MORPHOLOGY
Glaciology and chemistry of snow in eastern Queen Maud Land [1987, eng] **F-37479**
PHYSICAL PROPERTIES
Deformation of snow and ice at German antarctic stations [1984, ger] **F-34727**
Snow and ice features shown by thematic mapper and MSS images [1987, eng] **F-36073**
Temperature distribution in the antarctic ice cover along the profile Mirnyy Observatory-Vostok Station [1987, rus] **F-37149**
POLLUTION
Preliminary results of microbiological investigations at Mirnyy [1986, rus] **B-34720**
Antarctic terrestrial ecosystem [1987, eng] **B-35735**
Antarctic precipitation chemistry [1986, eng] **F-34892**
Morphological and chemical data on microparticles in antarctic snows [1986, eng] **F-35103**
Trace elements in surface snow near Showa Station [1986, eng] **F-35692**
Anthropogenic and natural lead in antarctic snow [1987, eng] **F-36163**
Master index for the carbon dioxide research State-of-the Art Report series [1987, eng] **I-36571**
SOUNDINGS
Vertical radar sounding of the antarctic layered snow [1985, rus] **F-37027**
STRATIGRAPHY
Nitrate deposition in Antarctica; temporal and spatial variations [1986, eng] **F-35469**
Stress-strain relation for dry snow in Greenland and Antarctica [1987, eng] **F-36911**
Casey snow runway meteorological records, 1984 [1987, eng] **I-36083**
STRUCTURE
Morphology of bullet-type snow crystals at Showa Station [1986, eng] **F-35691**
SURFACE FEATURES
Trace elements in surface snow near Showa Station [1986, eng] **F-35692**
Densification of snow/firn in the surface layer, antarctic ice sheet [1987, chi] **F-37328**
Surface windfield over the antarctic ice sheet [1987, eng] **I-35717**
TEMPERATURE
Riiser-Larsen's absolute movements, mass balance and snow temperature [1986, eng] **F-35871**
Casey snow runway tests, 1983-84 [1984, eng] **F-36082**
Densification of snow/firn in the surface layer, antarctic ice sheet [1987, chi] **F-37328**
Aerosol transport processes in the Antarctic [1985, eng] **I-35536**
Heat balance of the icy slope of Adelie Land [1988, eng] **I-37285**
THICKNESS
Vertical radar sounding of the antarctic layered snow [1985, rus] **F-37027**
VARIATIONS
Nitrate variability in South Pole and Ross Ice Shelf snow and firn [1985, eng] **F-35196**
VOLUME
Snow and ice indicators of climatic effects of increasing CO2 [1981, eng] **F-36498**
Cryosphere—neglected component of the climate system [1987, eng] **F-36986**

Solar activity
19th General Assembly, Vancouver, Canada, Aug. 9-22, 1987. Programme and abstracts [1987, eng] **A-36203**

Nitrate deposition in Antarctica; temporal and spatial variations [1986, eng] **F-35469**
Antarctic ozone change correlated to the stratospheric temperature field [1986, eng] **I-34955**
Ozone hole over Antarctica [1987, eng] **I-37144**
Aurora observation using the Showa Station 50-MHz Doppler radar [1986, eng] **K-34688**
Spatial distribution of anomalous phenomena in the southern high-latitude winter ionosphere from earth-based data [1984, eng] **K-35305**
View of the upper atmosphere from Antarctica [1985, eng] **K-35430**
North-south asymmetry of galactic cosmic rays [1986, eng] **K-35433**
Observation of solar brightness oscillations at the South Pole [1985, eng] **K-35545**
Advances in solar seismology at the South Pole [1985, eng] **K-35546**
Solar wind related to high latitude auroral absorption events [1986, eng] **K-35577**
ULF geomagnetic power at cusp latitudes in response to upstream solar wind conditions [1987, eng] **K-35609**
Frequency limits and modal structure of signals on the Moscow-Molodezhnaya route [1985, rus] **K-35637**
SUNDIAL campaigns [1987, eng] **K-35979**
Global characteristics of northward IMF-associated (NBZ) field-aligned currents [1987, eng] **K-36127**
Astronomy on ice [1986, eng] **K-36327**
Applicability of VLF phase observations on transpolar paths to observations of polar cap absorption [1987, rus] **K-36476**
Atmospheric studies by optical methods [1987, eng] **K-36518**
Hemispheric asymmetries in thermospheric structure and dynamics [1987, eng] **K-36637**
Interplanetary and geophysical effects of a coronal transient [1987, eng] **K-37183**
Thermospheric neutral wind measurements for both hemispheres [1987, eng] **K-37189**
Auroral model for the NCAR thermospheric general circulation model (TGCM) [1987, eng] **K-37190**

COSMIC RAY EVENTS
Nitrate flux on the Ross Ice Shelf and its relation to solar cosmic rays [1986, eng] **F-34971**
Influence of solar proton flares on changes of antarctic stratospheric temperature regime [1986, rus] **I-37231**
New insights into cosmic-ray propagation in the heliosphere [1985, eng] **K-35558**
Annual cosmic-ray variations in the lower atmosphere [1986, eng] **K-36262**
Time-dependence of the short-range component of cosmic rays in the stratosphere [1986, eng] **K-36263**
Interstellar shock waves and Be-10 from ice cores [1987, eng] **K-36586**
Cosmic ray intensity pulses [1979, eng] **K-36922**
Enhanced isotropic cosmic ray intensity waves during cosmic ray storms [1979, eng] **K-36923**
Cosmic ray latitude surveys in the Atlantic Ocean area [1987, eng] **K-37184**

Specimen collections

BIOLOGICAL
List of benthic algae at the Museum of Natural History, Santiago, Chile [1986, spa] **B-35264**
Culture and preparation of benthic algae specimens for electron microscopy [1986, eng] **B-35268**
Catalogue of microorganism strains, 1987 [1987, eng] **B-35927**
Spermatophore dimorphism in *Euchaeta antarctica* [1987, eng] **B-36308**
Catalog of lichens from material collected on South Shetland Islands during the *Antartic-86* expedition [1987, spa] **B-36388**
Marine fauna in shallow coastal waters near the Rauer Islands [1987, eng] **B-36764**
ADBEX III cruise: krill/zooplankton sampling data, Sep.-Dec. 1985 [1987, eng] **B-36766**
Tardigrada from the maritime Antarctic [1987, eng] **B-36846**
Species-poor testate rhizopod fauna on Brabant Island [1987, eng] **B-36848**
Energy sources for recruitment of a subantarctic copepod [1987, eng] **B-37286**
Identity of *Chonetes falklandicus* (Brachiopoda, Devonian) [1987, eng] **E-36953**

GEOLOGICAL
Palynology of core samples from the *S.P. Lee* Wilkes Land cruise [1987, eng] **E-36097**
Steranes and triterpanes in Beacon Supergroup samples [1987, eng] **E-36404**

Spermatophyta
Cortaderia pilosa (Gramineae) in Falkland Islands [1986, eng] **B-35034**

BREEDING CYCLES AND REPRODUCTION
Variability in vegetative and reproductive biomass in *Acaena adscendens* Vahl. (Rosaceae) at Kerguelen (South Indian Ocean) [1985, eng] **B-35527**

EMBRYOLOGY
Structurally preserved fossil plants from Antarctica. 3. Permian seeds [1987, eng] **E-35895**

EVOLUTION
New Triassic cycad from the Beardmore Glacier area of Antarctica [1985, eng] **E-35156**

GEOGRAPHIC DISTRIBUTION
Antarctic elements in Australasian rainforests [1986, eng] **B-34936**
Poa L. in New Zealand [1986, eng] **B-35594**
Fruiting plants of *Bryum* near Showa Station [1986, eng] **B-35675**
Revision of the *Coprosma pumila* (Rubiaceae) [1987, eng] **B-36683**
New Triassic cycad from the Beardmore Glacier area of Antarctica [1985, eng] **E-35156**
Fossil plants from Fildes Peninsula [1986, por] **E-36249**

MIGRATION
Pollen and spores transport into the Antarctic [1988, eng] **B-36818**

MORPHOLOGY
Poa L. in New Zealand [1986, eng] **B-35594**
Fruiting plants of *Bryum* near Showa Station [1986, eng] **B-35675**
Revision of the *Coprosma pumila* (Rubiaceae) [1987, eng] **B-36683**
Atlas of seeds and fruits from Macquarie Island [1986, eng] **B-37153**
New Triassic cycad from the Beardmore Glacier area of Antarctica [1985, eng] **E-35156**
Anatomically preserved *Glossopteris* from the Beardmore Glacier area of Antarctica [1985, eng] **E-35158**
New organ species in Lower Tertiary tafoflora from Fildes Peninsula [1986, spa] **E-35261**
Structurally preserved fossil plants from Antarctica. 3. Permian seeds [1987, eng] **E-35895**
Fossil plants from Fildes Peninsula [1986, por] **E-36249**
Palynology and paleoecology of Fildes Peninsula [1986, por] **E-36252**
Pliocene *Nothofagus* wood from the Transantarctic Mountains [1987, eng] **E-36774**
Palynological study on the Tertiary of King George and Brabant islands [1987, spa] **E-37037**

PATHOLOGY
Fossil fungi in antarctic wood [1985, eng] **E-35157**

TAXONOMY
Antarctic elements in Australasian rainforests [1986, eng] B-34936
Poa L. in New Zealand [1986, eng] B-35594
Fruiting plants of *Bryum* near Showa Station [1986, eng] B-35675
Revision of the *Coprosma pumila* (Rubiaceae) [1987, eng] B-36683
Taxonomy of *Carex* sect. *Abditispicae* sect. nov. (Cyperaceae) from austral South America [1987, eng] B-37086
Atlas of seeds and fruits from Macquarie Island [1986, eng] B-37153
New organ species in Lower Tertiary tafoflora from Fildes Peninsula [1986, spa] E-35261
Fossil plants from Fildes Peninsula [1986, por] E-36249
Palynology and paleoecology of Fildes Peninsula [1986, por] E-36252
Revision of the early Cretaceous flora from Hope Bay, Antarctica [1987, eng] E-36796
Significant additions to the Upper Triassic flora of Williams Point, Livingston Island, South Shetland Islands (Antarctica) [1987, eng] E-37036

Surface chlorophyll *a* distribution in the marginal ice zone, 1984-1985 [1986, eng] **B-35656**

Winter diatom distribution in the Weddell Sea [1987, eng] B-35930
Genus *Hydrolithon* in subantarctic and antarctic coastal areas [1986, fre] B-36455
Biological production at the ice-water ergocline [1986, eng] B-36563

MORPHOLOGY
Epiphytic diatoms of the inshore marine area near Davis Station [1986, eng] B-34744
Sporangia in the antarctic alga *D. ligulata* [1977, eng] B-34843
Two species of the genus *Thalassiosira* [1983, eng] B-34868
Morphology, distribution and ecology of terrestrial alga *Pseudococcomyxa simplex* [1987, eng] B-34918
Notophycus fimbriatus (Solieriaceae), n.sp. from the Antarctic Peninsula [1986, eng] B-35061
Morphology and taxonomy of antarctic benthic diatoms [1984, rus] B-35083
Freshwater diatoms from Kerguelen Islands, excluding Monoraphideae [1986, fre] B-35407
Biomass of *Curvillea antarctica* (Cham.) Hariot (Phaeophyceae) in the Bay of Morbihan, Kerguelen Island (South Indian Ocean) [1985, eng] B-35528
Morphological variation in antarctic diatom, genetic analysis [1987, eng] B-35855
Study of epiphytic diatoms in Newcomb Bay, Antarctica [1983, chi] B-36011
Parmales, a new order of marine chrysophytes [1987, eng] B-36452
Genus *Hydrolithon* in subantarctic and antarctic coastal areas [1986, fre] B-36455
Heterococcus morphological changes and response to temperature [1987, eng] B-36957
Diatoms of the South Orkney Islands [1987, eng] B-37391
Studies on algae from inland waters on East Ongul I. [1987, eng] B-37468

PHYSIOLOGY
Inshore seasonal changes in diatoms near Davis Station [1986, eng] B-34683
Influence of sea ice and sea ice biota on light in McMurdo Sound [1984, eng] B-34735
Photoadaptation of a colonial microalgal bloom in McMurdo Sound [1986, eng] B-34788
Microalgal carbon assimilation in sea ice of East Antarctica [1985, eng] B-34828
Phycobiliprotein pigments of red algae [1985, eng] B-34833
Temperature and light effects on phytoplankton mass balance [1987, eng] B-34920
Lipids and blue-green algal mats in lakes [1986, eng] B-35063
Fatty acid composition and microbial activity in McMurdo Sound sediments [1986, eng] B-35122
Photosynthesis and carbon metabolism of phytoplankton from McMurdo Sound, Pt1 [1987, eng] B-35124
Growth and physicochemical parameters of diatoms [1987, fre] B-35229
Culture and preparation of benthic algae specimens for electron microscopy [1986, eng] B-35268
Lipid composition and microbial activity of selected recent antarctic benthic marine sediments and organisms: a mechanism for monitoring and comparing microbial populations [1985, eng] B-35360
Photoadaptive strategies in a natural population of *Phaeocystis pouchetii* in McMurdo Sound [1985, eng] B-35361
Photoadaptations of photosynthesis and carbon metabolism by antarctic phytoplankton: species-specific and community responses [1985, eng] B-35368
Sea ice microbial communities. 6. Growth and primary production in bottom ice under graded snow cover [1987, eng] B-35443
Sea ice microbial communities. 7. Changes in under-ice spectral irradiance during the developments of antarctic sea ice microalgal communities [1987, eng] B-35444
Bacterial production in annual sea ice in McMurdo Sound [1987, eng] B-35445
Hydrocarbons in benthic algae from Vestfold Hills [1987, eng] B-35464
Ecology of snow algae [1986, eng] B-35588
Ice-algae photosynthesis under fast ice at Showa Station [1986, eng] B-35657
Decomposition of organic matter under fast ice at Lützow-Holm Bay [1986, eng] B-35659
Snow algal bloom and habitat at Showa Station [1986, eng] B-35671
Biochemical studies of algae: detection of ferredoxin [1986, eng] B-35673
Morphological variation in antarctic diatom, genetic analysis [1987, eng] B-35855
Seasonal variation in phytoplankton and ice algae in shallow coast site [1987, eng] B-35867
Chemical and taxonomic study of antarctic organisms [1987, spa] B-36363
Incorporation of amino acids and glucose in microalgae [1987, eng] B-36457
Physiological ecology of modern stomatolitic algal mats in lakes [1985, eng] B-36559
Humic substances resulting from decay of aquatic plants [1987, eng] B-36772
Heterococcus morphological changes and response to temperature [1987, eng] B-36957
Marine resources. Algae: potential uses in pharmacology [1987, spa] B-36981
Sea ice microbial communities (SIMCO). 9. Effects of temperature and salinity on rates of metabolism and growth of autotrophs and heterotrophs [1988, eng] B-37127
Austral spring microalgae across the Weddell Sea ice edge: spatial relationships found along a northward transect during AMERIEZ 83 [1988, eng] B-37161
Biomedical aspects of antarctic research [1986, por] B-37200
Occurrence of an isoprenoid C25 diunsaturated alkene and high neutral lipid content in antarctic sea-ice diatom communities [1988, eng] B-37238
Growth rates of antarctic marine phytoplankton in the Weddell Sea [1987, eng] B-37289
Comparison of photosynthesis diel patterns in polar and temperate phytoplankton [1988, eng] B-37377
Sedimentation in ice-covered Lake Hoare, Antarctica [1987, eng] E-36952
Cumulation of chloroorganic insecticides by antarctic marine diatoms [1987, eng] J-37172

POPULATION
Phytoplankton in the Indian Ocean [1986, eng] B-34664
Epiphytic diatoms of the inshore marine area near Davis Station [1986, eng] B-34744
Mesoscale cycling of nitrogen and silicon in Ross Sea phytoplankton blooms [1986, eng] B-34786
Cell division rates in algae of McMurdo Sound [1986, eng] B-34790
Antarctic stream ecosystems: variability in environmental properties and algal community structure [1986, eng] B-34791
Phytoplankton communities in the Indian Ocean at the end of summer [1987, fre] B-35226
Phytoplankton from the southwestern Atlantic Ocean [1985, eng] B-35367
Sea ice microbial communities. 6. Growth and primary production in bottom ice under graded snow cover [1987, eng] B-35443
Sea ice microbial communities. 7. Changes in under-ice spectral irradiance during the developments of antarctic sea ice microalgal communities [1987, eng] B-35444
Bacterial production in annual sea ice in McMurdo Sound [1987, eng] B-35445
Biomass of *Curvillea antarctica* (Cham.) Hariot (Phaeophyceae) in the Bay of Morbihan, Kerguelen Island (South Indian Ocean) [1985, eng] B-35528
Ice diatom floras in Arthur Harbor [1987, eng] B-35618
Seasonal variation in phytoplankton and ice algae in shallow coast site [1987, eng] B-35867
ATP in rocks and biomass determination [1987, eng] B-36110
Summer tide-crack phytoplankton in McMurdo Sound [1987, eng] B-36331
Biological production at the ice-water ergocline [1986, eng] B-36563
Diatoms of the McMurdo Ice Shelf [1987, eng] B-36685
Transfer functions between diatom assemblages and surface hydrology in the southern ocean [1987, eng] B-36689
Algal assemblages in antarctic pack ice and in ice-edge plankton [1987, eng] B-36956
Soil algae at Bellingshausen Station [1984, rus] B-36999
Study of sea algae in the King George I. coastal area, near Bellingshausen Station [1984, rus] B-37000

Thallophyta-Algae
POPULATION *(cont.)*

Antarctic marine fungi: a preliminary account [1986, eng] **B-35416**
MORPHOLOGY
Fossil mycorrhizae: a case for symbiosis [1987, eng] **B-36459**
Teleomorph of the first fungus described from Antarctica [1987, eng] **B-36467**
Ecological peculiarities of mycelial fungi from antarctic ice [1987, rus] **B-36944**
PHYSIOLOGY
Antarctic marine fungi: a preliminary account [1986, eng] **B-35416**
Applied and environmental microbiology [1986, eng] **B-35427**
DNA relatedness among aquatic yeasts *Metschnikowia* [1985, eng] **B-35467**
POPULATION
Antarctic marine fungi: a preliminary account [1986, eng] **B-35416**
TAXONOMY
DNA relatedness among aquatic yeasts *Metschnikowia* [1985, eng] **B-35467**
Teleomorph of the first fungus described from Antarctica [1987, eng] **B-36467**

Thallophyta-Lichens
Floristic survey of algae at four locations in northern Victoria Land [1987, eng] **B-36268**
ECOLOGY
Lichen colonies in dry valley rocks [1983, ger] **B-34844**
Dark respiration of a foliose lichen form Signy Island [1986, eng] **B-34903**
Coastal lichens in the South Shetland Islands [1987, eng] **B-37407**
GEOGRAPHIC DISTRIBUTION
Lichens *Cladia* and *Cladonia* on Macquarie Island [1986, eng] **B-35285**
Lichens and lichen parasites from Queen Maud Land, 1949-52 [1986, eng] **B-35428**
Botany of the Mühlig-Hofmann and Gjelsvik Mountains, Part I [1986, eng] **B-35492**
Catalog of lichens from material collected on South Shetland Islands during the *Antartic-86* expedition [1987, spa] **B-36388**
Epilithic lichens in Beacon sandstone formation, Victoria Land [1987, eng] **B-36628**
Coastal lichens in the South Shetland Islands [1987, eng] **B-37407**
MORPHOLOGY
Studies on Macquarie Island lichens 3: the genus Sphaerophorus [1986, eng] **B-35284**
Lichens *Cladia* and *Cladonia* on Macquarie Island [1986, eng] **B-35285**
Lichens and lichen parasites from Queen Maud Land, 1949-52 [1986, eng] **B-35428**
Carbohydrate release during freeze-thaw at Signy Island [1987, eng] **B-36043**
Epilithic lichens in Beacon sandstone formation, Victoria Land [1987, eng] **B-36628**
PHYSIOLOGY
Lichen substrates and urease production and secretion in four species [1986, eng] **B-34890**
Dark respiration of a foliose lichen form Signy Island [1986, eng] **B-34903**
Carotenoid composition of a lichen and of penguin feces [1986, eng] **B-35602**
Carotenoids in lichens [1986, eng] **B-35603**
Photosynthesis and water relations of three maritime antarctic lichen species [1987, eng] **B-36104**
Luteoxanthin and Apo-12'-Violaxanthal in lichens [1987, eng] **B-37042**
TAXONOMY
Studies on Macquarie Island lichens 3: the genus Sphaerophorus [1986, eng] **B-35284**
Lichens *Cladia* and *Cladonia* on Macquarie Island [1986, eng] **B-35285**
Lichens and lichen parasites from Queen Maud Land, 1949-52 [1986, eng] **B-35428**
Catalog of lichens from material collected on South Shetland Islands during the *Antartic-86* expedition [1987, spa] **B-36388**
Algological study in Schirmacher and Unter-See lakes [1987, ger] **B-36454**
Epilithic lichens in Beacon sandstone formation, Victoria Land [1987, eng] **B-36628**

Thawing

Tropopause
Satellite springtime measurements of ozone, nitrogen dioxide, and aerosols [1986, eng] **I-34975**

Troposphere
Structure of medium-scale atmospheric waves in the Southern Hemisphere summer [1983, eng] **I-34725**
Southern Hemisphere annual zonal temperature of the troposphere and lower stratosphere [1986, eng] **I-34851**
Balloon observation of aerosols in the antarctic troposphere and stratosphere [1986, eng] **I-34855**
Stratospheric and tropospheric sources for nitrate in antarctic snow [1986, eng] **I-34857**
Tropospheric ozone at four remote observatories [1985, eng] **I-34947**
Antarctic ozone decreases: a dynamical cause? [1986, eng] **I-34984**
Energy estimation of atmospheric circulation over the southern ocean [1984, rus] **I-35072**
Trend of bromochlorodifluoromethane and the concentrations of other bromine-containing gases at the South Pole [1985, eng] **I-35537**
Stratospheric aerosol descent in winter and effects on water vapor budget [1986, eng] **I-35688**
Planetary waves in winter troposphere and stratosphere. Part 1 [1987, eng] **I-35722**
Planetary waves in winter troposphere and stratosphere. Part 2 [1987, eng] **I-35723**
Chemistry of the global troposphere: fluorocarbons as tracers of air motion [1987, eng] **I-35724**
Structure of thermal fields of the free atmosphere over Antarctica [1986, eng] **I-35832**
Main features of atmospheric circulation over Antarctica [1986, eng] **I-35841**
Structure of atmospheric processes and its relation to some oceanographic features in the Atlantic Ocean [1986, rus] **I-35940**
Internal gravity wave in lower troposphere at Halley Station [1987, eng] **I-36116**
Global distribution of methane in the troposphere [1987, eng] **I-36393**
Meteorological activities of the Third Indian Antarctic Expedition, 1983-1984 summer [1986, eng] **I-36742**
Simulation of gravity wave effects under solstice conditions using a 3-D circulation model of the middle atmosphere [1986, eng] **I-36854**
Vertical structure of monthly fluctuations of the Southern Hemisphere troposphere [1987, eng] **I-36914**

Turbidity
See: Visibility

Upper air
Meteorological observations at Showa Station in 1981 by JARE [1986, jpn] **I-35209**
Antarctic meteorological data. Vol.26. Meteorological data at the Syowa Station in 1985 [1987, eng] **I-36013**
Antarctic meteorological data. Special volume No.4. Total amount of ozone (1981-1985); vertical ozone (sonde) (1981-1984); long wave radiation (1981-1983) [1986, eng] **I-36014**
Lidar measurement of the antarctic mesospheric sodium layer [1987, eng] **I-36060**
Glaciological research program in east Queen Maud Land, East Antarctica, Part 6, Advance Camp, 1985 [1987, eng] **I-36573**
Meteorological studies at Dakshin Gangotri, Mar. 1984 to Feb. 1985 [1986, eng] **I-36743**
Vertical structure of monthly fluctuations of the Southern Hemisphere troposphere [1987, eng] **I-36914**
Short term upper air temperature and wind variability in high latitudes [1987, rus] **I-36930**
Analysis of the 1000-300 hPa thickness field using satellite imagery [1985, eng] **I-37146**

Upper air *(cont.)*
Meteorological data at Showa Station 1986 [1987, eng] I-37514
Proceedings of Nagata Symposium on atmospheric physics [1987, eng] K-36629
See also: Stratosphere; Tropopause
PRESSURE
Comparison of Southern Hemisphere circulation statistics [1987, eng] I-36958
TEMPERATURE
Quasi-geostrophic flow solution for the circulation over Antarctica [1986, eng] I-35485
Winter variation statistics of antarctic upper air meteorological parameters [1987, rus] I-36927
Antarctic springtime ozone depletion computed from temperature observation [1988, eng] I-37329
WIND
Southern Hemisphere blocking during the FGGE [1987, eng] I-35058
Quasi-geostrophic flow solution for the circulation over Antarctica [1986, eng] I-35485
Transient eddies in zonal flow during blocking episodes [1986, eng] I-35498
Global ozone transport related to planetary waves [1987, eng] I-35579
Vertical wind profile over Admiralty Bay [1987, eng] I-36125
Role of eddies in maintaining the westerlies in the Southern Hemisphere winter [1987, eng] I-36418
Effect of Antarctica on upper level flows during the 1979 winter [1986, eng] I-36663
Indices of the Southern Hemisphere zonal wind [1986, eng] I-36672
Multiple planetary flow regimes in the Southern Hemisphere [1986, eng] I-36673
Southern Hemisphere winter/spring circulation [1986, eng] I-36677
Comparison of Southern Hemisphere circulation statistics [1987, eng] I-36958
Multiple planetary flow regimes in the Southern Hemisphere [1987, eng] I-37102
ECC ozonesonde observations at South Pole, 1987 [1988, eng] I-37175
Neutral wind observations over Showa Station [1988, eng] I-37440

Variations
See under: Firn; Glacier ice; Ice; Ice sheet; Sea ice; Shelf ice; Snow.
See also: Geomagnetic field/Secular variations; Geomagnetic field/-Transient variations; Ionosphere/Diurnal variations

Vehicles
Activities of the wintering party of the 26th JARE [1987, eng] D-35743
Sea ice operation: McMurdo Sound-Granite Harbour [1986, eng] F-35296
Air/ground transportation in Antarctic logistics support [1986, eng] G-34996
See also: Aircraft; Rockets; Ships
AIR CUSHION
Operation of light air cushion vehicle at McMurdo Sound [1987, eng] G-35052
SNO-CATS
Operating of the Antarctic icebreaker *Shirase* and traverse by snow vehicle [1986, eng] G-35002
TRUCKS
Moving loads on sea ice [1987, eng] F-35773
WEASELS
Tracked firefighting vehicles for the Arctic and Antarctic [1986, eng] G-35004

Ventilation
Antarctic housing [1987, spa] G-36530

Vermes
Summer diet of Commerson dolphin from Kerguelen Islands [1984, fre] B-34758
ECOLOGY
Redescription of the *Echinoderes pilosus* (Kinorhyncha: Cyclorhagida) [1986, eng] B-34891
Organization of earthworm communities on Possession Island, Crozet Islands [1987, fre] B-37367
GEOGRAPHIC DISTRIBUTION
Biogeographical grouping by dendrite analysis [1986, eng] B-35604
Terrestrial nematodes around Showa Station [1986, eng] B-35680
Macroplankton zoogeography and community analysis [1987, ger] B-35851
Distribution of meso- and macrozooplankton in Weddell Sea surface water [1987, ger] B-35856
Pelagic polychaetes collected during the 1st Brazilian Antarctic Expedition [1986, por] B-36241
Deep sea polychaete fauna formation, family Polynoidae [1984, eng] B-36870
Systematics, ecology and distribution of Southern Hemisphere spirorbids (Polychaeta; Spirorbidae) [1984, eng] B-36872
MORPHOLOGY
Redescription of the *Echinoderes pilosus* (Kinorhyncha: Cyclorhagida) [1986, eng] B-34891
Filaroid nematode (Lemdaninae) from *Larus dominicanus* [1986, eng] B-35134
Two new species of flatworms from *Promachocrinus kerguelensis* [1987, eng] B-36128
Pelagic polychaetes collected during the 1st Brazilian Antarctic Expedition [1986, por] B-36241
New species of parasite in finned octopod [1983, eng] B-36542
Polychaeta Oweniidae collected by USARP [1984, eng] B-36871
Reighardia sternae (Diesing, 1864) (Pentastomida) from seabirds in Antarctica [1987, eng] B-36964
Rotifers of the genus *Brachionus,* new for Antarctica [1987, spa] B-37135
New species of Eucestoda from pelecaniform hosts [1987, eng] B-37164
PHYSIOLOGY
Trace element content in two species of whale tapeworms [1986, eng] B-35321
POPULATION
Distribution of meso- and macrozooplankton in Weddell Sea surface water [1987, ger] B-35856
Pelagic polychaetes collected during the 1st Brazilian Antarctic Expedition [1986, por] B-36241
Chaetognaths, polychaetes and amphipods in waters off South Orkney Is. [1987, spa] B-36728
Organization of earthworm communities on Possession Island, Crozet Islands [1987, fre] B-37367
TAXONOMY
Filaroid nematode (Lemdaninae) from *Larus dominicanus* [1986, eng] B-35134
Terrestrial nematodes around Showa Station [1986, eng] B-35680
Two new species of flatworms from *Promachocrinus kerguelensis* [1987, eng] B-36128
New species of parasite in finned octopod [1983, eng] B-36542
Deep sea polychaete fauna formation, family Polynoidae [1984, eng] B-36870
Polychaeta Oweniidae collected by USARP [1984, eng] B-36871
Rotifers of the genus *Brachionus,* new for Antarctica [1987, spa] B-37135
New species of Eucestoda from pelecaniform hosts [1987, eng] B-37164

Visibility
Background of atmospheric transparency regime [1986, eng] I-35817
Statistical approach to visibility forecasting at McMurdo [1986, eng] I-36676
Anomalous decrease of atmospheric transparency over Antarctica [1987, rus] I-37071
Hydrometeorological regime of the southern ocean in summer 1982-1983 [1987, rus] I-37074

VLF emissions
19th General Assembly, Vancouver, Canada, Aug. 9-22, 1987. Programme and abstracts [1987, eng] A-36203
View of the upper atmosphere from Antarctica [1985, eng] K-35430
Siple VLF transmitter probes ionosphere and magnetosphere [1985, eng] K-35555
New type of VLF emission from Siple Station [1985, eng] K-35557
Simultaneous ionospheric data from Siple and Halley Stations [1985, eng] K-35560
Observations of auroral LHR noise by the sounding rocket S-310JA-6 [1987, eng] K-35606

Compilatory data processing at Showa Station [1987, eng] K-35747
AVDAS, a microcomputer-based system [1987, eng] K-35762
ULF/VLF correlator experiment at Halley [1987, eng] K-35763
Monochromatic auroral images at Showa Station [1987, eng] K-35882
Ninth symposium on ionospheric research, Tokyo, 1986 [1987, eng] K-36055
Narrow-banded ELF emissions over the southern polar region [1987, eng] K-36221
Variations of ELF emissions at conjugate points [1987, eng] K-36336
Applicability of VLF phase observations on transpolar paths to observations of polar cap absorption [1987, rus] K-36476
Upper atmosphere physics data, Syowa Station, 1985 [1987, eng] K-36574
Geomagnetically conjugate phenomena since the IGY [1987, eng] K-36630
VLF wave injection, experiments from Siple Station, Antarctica [1987, eng] K-36634
Magnetic conjugacy as observed at the apex of field lines: Geos-1 and -2 results [1987, eng] K-36635
PCA effects on a VLF transantarctic propagation path [1987, eng] K-36649
Observations of the VLF quiet band phenomenon [1986, eng] K-36912
VLF emissions triggered by nonducted waves [1981, eng] K-36917
Pc 1 polarization and particle precipitation [1979, eng] K-36919
Siple VLF transmitter as a multi-frequency probe [1988, eng] K-37284

GEOGRAPHIC INDEX

Ace Lake
Bacterial and algal hydrocarbons in Ace Lake sediments [1986, eng] **E-35110**

Adélie Coast
Three reporters 11 to 16 years old in Antarctica [1987, fre] **A-35770**
Coastal seawater bacteria and avifauna [1987, eng] **B-36698**
Short-term variations of bacterioplankton from Adélie Coast [1988, eng] **B-37341**
Status and conservation of sea birds of French subantarctic islands and Adélie Land [1984, eng] **B-37427**
Glacial erosion on the George V/Adélie continental margin, East Antarctica [1985, eng] **E-35202**
Accumulation distribution in Adélie Coast and meteorological parameters [1986, eng] **F-36034**
"IAGO-Katabatic" programme [1986, eng] **I-34673**
Wind and temperature regime on Adélie Land slopes [1986, eng] **I-35030**
Automatic weather stations in eastern Antarctica [1985, eng] **I-35541**
"Radiation paradox" on the slopes of the antarctic continent [1987, eng] **I-36188**
Katabatic winds in Adélie Land [1985, eng] **I-36202**
Heat balance of the icy slope of Adelie Land [1988, eng] **I-37285**

Admiralty Bay
Physiological groups of microorganisms in soils at Admiralty Bay [1986, eng] **B-35587**
Distribution, abundance and biomass of Admiralty Bay birds, 1978-1979 [1986, eng] **B-35598**
Matter transport in waters of Admiralty Bay [1987, eng] **B-36784**
Microclimate of the nest sites of pygoscelid penguins in Admiralty Bay [1986, eng] **I-35586**
Vertical wind profile over Admiralty Bay [1987, eng] **I-36125**
Air pollution and natural atmospheric sedimentation over Admiralty Bay [1987, eng] **I-37169**
Hydrological conditions in Admiralty Bay in summer 1982 [1986, rus] **J-35945**
Cumulation of chloroorganic insecticides by antarctic marine diatoms [1987, eng] **J-37172**
Rate of isostatic movement on the Admiralty Bay shores [1985, eng] **L-35866**

Admiralty Mountains
Chronology of volcanics and rocks, Victoria Land [1986, eng] **E-35909**

Alamode Island
Deschampsia antarctica and *Colobanthus quitensis* in the Terra Firma Islands [1987, eng] **B-35316**

Alasheyev Bight
Ice conditions in Alasheyev Bight [1987, rus] **F-37064**

Alexander Island
Structural history of the LeMay Range [1987, eng] **E-36839**
Biostratigraphy of Fossil Bluff, Alexander Island [1988, eng] **E-37113**

Allan Hills
Clay-mineraloid weathering products in antarctic meteorites [1986, eng] **E-34759**
Chemistry of geological samples from Allan Hills and Carapace Nunatak [1986, eng] **E-34780**
Terrestrial 81Kr-Kr ages of antarctic meteorites [1986, eng] **E-35022**
Dating till by paleomagnetism: Allan Hills, southern Victoria Land [1985, eng] **E-35159**
Search for antarctic meteorites, 1984-1985 [1985, eng] **E-35188**
Steranes and triterpanes in Beacon Supergroup samples [1987, eng] **E-36404**
Uranium-series dating of Allan Hills ice [1985, eng] **F-35197**
New types of spherules from Antarctica: meteoritic impact origin? [1987, eng] **F-37097**

American Highland
Antarctic ice sheet configuration 30 deg E to 80 deg E [1986, eng] **C-34769**

Amery Ice Shelf
Mapping Amery Ice Shelf [1987, eng] **C-36077**
Radar altimetry delineates ice shelf boundaries and elevations [1987, eng] **C-36080**
Geological and geophysical surveys off Amery Ice Shelf toward Kerguelen Plateau [1986, eng] **E-34774**
Field studies Jetty Peninsula with the 30th SAE [1985, eng] **E-35187**

Amos Lake
Microbial activity in seasonally anoxic maritime lake [1988, eng] **B-37129**

Amsterdam Island
Maritime fur trade: sealers and other residents on St. Paul and Amsterdam islands. Pts. 1 and 2 [1984, eng] **A-37489**
John Balleny and Amsterdam Island [1984, eng] **A-37491**
Behavioral cues to individual recognition in the subantarctic fur seal *Arctocephalus tropicalis* [1987, eng] **B-37303**
Recolonization processes in the subantarctic fur seal *Arctocephalus tropicalis* on Amsterdam Island [1987, eng] **B-37307**
Adventitious Phanerogams on Amsterdam Island [1987, fre] **B-37364**

Amundsen-Scott Station
My eight hours at the South Pole [1986, eng] **A-34906**
Report on CSIC's activities [1987, spa] **A-36485**
Sulphuric acid in the antarctic ice sheet [1987, eng] **E-36046**
Tephra in ice cores from Vostok and Amundsen-Scott stations [1987, eng] **E-36506**
International antarctic glaciological program activities at South Pole Station and Vostok [1985, eng] **F-35200**
Anthropogenic and natural lead in antarctic snow [1987, eng] **F-36163**
Baseline acidity of South Pole precipitation [1987, eng] **F-36505**
Development of methodology for design of snow roads and airstrips [1986, eng] **F-36873**
Amundsen-Scott Station, general information [1985, eng] **G-34723**
Navy support to USARP, 1984-1985 [1985, eng] **G-35573**
Assessing the usable life of an antarctic station [1986, eng] **G-36834**
Collapse prediction analysis of the South Pole dome [1988, eng] **G-37325**
Identification of parainfluenza virus serotypes by indirect solid-phase enzyme immunoassay [1982, eng] **H-35011**
Aerosol measurements at the South Pole [1986, eng] **I-34856**
Seven years of total ozone from the TOMS instrument: a report on data quality [1986, eng] **I-34994**
Global atmospheric CO2 related to equatorial SST [1987, eng] **I-35478**
Aerosol transport processes in the Antarctic [1985, eng] **I-35536**
Measurements of column amounts of atmospheric trace gases during the antarctic winter [1985, eng] **I-35538**
Atmospheric particle collections at Amundsen-Scott South Pole Station during 1984 [1985, eng] **I-35540**
High-altitude aerosol variations associated with stratospheric warmings [1985, eng] **I-35544**
NOAA/GMCC continuous CO2 record at the South Pole, 1975-1982 [1987, eng] **I-35580**
Atmospheric iridium at the South Pole as a measure of the meteoritic component [1987, eng] **I-36412**
Atmospheric HCl over the South Pole Dec. 1986 [1987, eng] **I-36609**
Measurements of several nitrogen species over the South Pole [1987, eng] **I-36613**
Interannual variation of atmospheric CO2 concentration [1986, eng] **I-36884**
ECC ozonesonde observations at South Pole, 1987 [1988, eng] **I-37175**
Flux transfer events in the polar ionosphere [1986, eng] **K-34911**
Observation of solar brightness oscillations at the South Pole [1985, eng] **K-35545**
Advances in solar seismology at the South Pole [1985, eng] **K-35546**
Far infrared astronomy at the South Pole [1985, eng] **K-35548**
Pc 1 magnetic pulsations at the South Pole [1985, eng] **K-35549**
Poleward surges of auroral phenomena over the South Pole [1985, eng] **K-35550**
Seasonal variations in auroral absorption [1985, eng] **K-35552**
Pc 3 pulsations observed near the south polar cusp [1986, eng] **K-35583**
ULF geomagnetic power at cusp latitudes in response to upstream solar wind conditions [1987, eng] **K-35609**

Amundsen-Scott Station *(cont.)*
Ground and space measurements of a south polar auroral surge [1987, eng] **K-36310**
Astronomy on ice [1986, eng] **K-36327**
Cosmic noise absorption at South Pole and Frobisher Bay: initial results [1987, eng] **K-36638**
Statistics of auroral radio absorption at Siple and South Pole [1987, eng] **K-36648**
1985-1986 South Pole balloon campaign [1987, eng] **K-36650**
Cosmic ray intensity pulses [1979, eng] **K-36922**
Enhanced isotropic cosmic ray intensity waves during cosmic ray storms [1979, eng] **K-36923**
Bursts of Pc 1-2 and flux transfer events [1988, eng] **K-37012**

Amundsen Sea
Late Quaternary deglaciation of the Amundsen Sea [1987, eng] **F-36292**
Recent glacial history and rapid ice stream retreat in the Amundsen Sea [1987, eng] **F-36341**

Antarctic Peninsula
Sailboat among the icebergs [1985, ita] **A-35651**
Predatory behavior in early life stages of Notothenioid fishes [1986, ger] **B-34756**
Feeding biology of the brittle star *Astrotoma agassizii* [1986, eng] **B-34797**
Crustacea Tanaidacea of the Antarctic and the Subantarctic [1986, eng] **B-34823**
Zooplankton community of Croker Passage, Antarctic Peninsula [1985, eng] **B-34831**
Sporangia in the antarctic alga *D. ligulata* [1977, eng] **B-34843**
Shallow-water foraminiferal ecology, Pacific Ocean [1980, eng] **B-34847**
Notophycus fimbriatus (Solieriaceae), n.sp. from the Antarctic Peninsula [1986, eng] **B-35061**
Adult and juvenile stages of two mites of the maritime Antarctic [1987, eng] **B-35317**
Euphausia superba: a preliminary report on three areas of investigation [1985, eng] **B-35373**
Extraction and measurements of adenosine triphosphate in water [1987, eng] **B-35716**
Macroplankton zoogeography and community analysis [1987, ger] **B-35851**
Krill population age structure near the Antarctic Peninsula [1987, rus] **B-36282**
Winter primary productivity in sea ice, Antarctic Peninsula region [1987, eng] **B-36319**
Chemical and taxonomic study of antarctic organisms [1987, spa] **B-36363**
On the occurrence and biology of some antarctic Mysidacea (Crustacea) [1988, eng] **B-36819**
Censuses of penguin populations of the Antarctic Peninsula, 1983-87 [1987, eng] **B-36842**
Reighardia sternae (Diesing, 1864) (Pentastomida) from seabirds in Antarctica [1987, eng] **B-36964**
Age and growth of antarctic Euphausiacea (Crustacea) under natural conditions [1987, eng] **B-36992**
New species of Eucestoda from pelecaniform hosts [1987, eng] **B-37164**
Antarctic aquatic biology [1987, eng] **B-37388**
Sea birds of antarctic maritime regions, 20W to 80W [1984, eng] **B-37449**
Aspects of ecology and biogeography of acanthocephala in antarctic seabirds [1986, eng] **B-37476**
U.S.-Argentina-Chile aerial survey over Antarctic Peninsula region [1987, eng] **C-36924**
Development of the South Shetland Islands and the Antarctic Peninsula [1986, eng] **E-34732**
Tectonic structures on the eastern edge of the Antarctic Peninsula in relation to the compression belt of the Mesozoic volcanic arc [1986, spa] **E-34927**
Geochemistry and tectonic setting of gabbroic rocks in the Scotia Arc Basin [1986, eng] **E-35093**
Reconnaissance geology on the northern Antarctic Peninsula [1985, eng] **E-35182**
Aeromagnetic survey of the Neny Fjord area [1987, eng] **E-35764**
Gondwanian orogeny within the Antarctic Peninsula: a discussion [1987, eng] **E-35797**
Structural evolution of the magmatic arc in northern Palmer Land [1987, eng] **E-35799**
Post-Triassic sedimentary basin in the Antarctic Peninsula [1986, spa] **E-35859**
Paleolimnological and geomorphological investigations on King George Island, 1984-1986 [1986, pol] **E-36041**
Very conductive layer below permafrost, eastern Antarctic Peninsula [1987, eng] **E-36265**
Contribution to sedimentary micropaleontology research in Antarctica [1987, spa] **E-36383**
Cretaceous palynomorphs from the Antarctic Peninsula [1987, eng] **E-36838**
Dynamics and development of arctic and antarctic coasts [1985, ger] **E-37007**
Morphological and chemical data on microparticles in antarctic snows [1986, eng] **F-35103**
Sulphuric acid at grain boundaries in antarctic ice [1988, eng] **F-37005**
Meteorological conditions at Druzhnaya Base in summer 1980 [1986, rus] **I-36197**
Preliminary report on atmospheric radon over the Antarctic Peninsula [1986, eng] **I-36256**
Biogenic sulfur from the subantarctic and antarctic oceans [1987, eng] **I-36612**
Suspended particulate matter in antarctic coastal waters [1985, eng] **J-35344**
USAP 1988 Cruise III, RV *Polar Duke* cruise report [1988, eng] **J-37281**

Anuchin Glacier
Unusual moraine [1987, rus] **F-37079**

Anvers Island
Cold-hardiness in the antarctic tick, *Ixodes uriae* [1987, eng] **B-36180**
Revised penguin numbers and distribution, Anvers Island [1987, eng] **B-36211**
Fidelity in Brown skuas of Anvers island [1987, eng] **B-36804**
Reighardia sternae (Diesing, 1864) (Pentastomida) from seabirds in Antarctica [1987, eng] **B-36964**

Arctowski Station
Fungi as aerosphere component in Arctowski Station area [1987, eng] **B-37170**
Dynamics of simple arithmetic task performance under antarctic isolation [1985, eng] **H-36554**
Analysis of tides at Arctowski Station, Nov.-Dec. 1986 [1987, spa] **J-36359**
Geomagnetic observations at Arctowski Station, 1980-1981 [1985, eng] **L-36422**

Ardley Island
Breeding petrels on Ardley Island [1986, spa] **B-35265**
Eco-ethological variables in a rookery on Ardley Island [1987, spa] **B-35891**

Arrival Heights
Dynamic and chemically controlled variations of stratospheric NO2 and O3 [1986, eng] **I-34970**

Arthur Harbor
Ciliates and nanophytoplankton in Arthur Harbor, December 1984 and January 1985 [1985, eng] **B-35362**
Ice diatom floras in Arthur Harbor [1987, eng] **B-35618**

Artigas Station
Meteorological investigations in Antarctica [1987, spa] **I-35887**

Asgard Range
Microbial environment in Ross desert from satellite nanoclimate data, 1984-1986 [1987, eng] **B-36120**
Antarctic cold desert and the search for traces of life on Mars [1986, eng] **B-36900**

Asuka Camp
Gravity surveys by JARE-27 near Showa Station and Asuka Camp [1986, jpn] **L-35207**

Bach Ice Shelf
Imaging subglacial topography by a synthetic aperture radar technique [1987, eng] **F-36075**

Barry Island
Rotifers of the genus *Brachionus,* new for Antarctica [1987, spa] **B-37135**

Barton Peninsula
Fossil flora from Barton Peninsula [1987, eng] **E-37274**

Beacon Heights
Chemical weathering of Beacon Supergroup sandstones [1986, eng] **E-35257**

Beardmore Glacier
New Triassic cycad from the Beardmore Glacier area of Antarctica [1985, eng] **E-35156**

Fossil fungi in antarctic wood [1985, eng] **E-35157**
Anatomically preserved *Glossopteris* from the Beardmore Glacier area of Antarctica [1985, eng] **E-35158**
Structurally preserved fossil plants from Antarctica. 3. Permian seeds [1987, eng] **E-35895**

Beaver Lake
Alkaline-ultramafic bodies in the Beaver Lake area [1987, rus] **E-36933**

Belgica Mountains
Amphibolite facies mineral assemblages in the Belgica Mountains [1986, eng] **E-34777**

Belgrano II Station
Occlusion of polynucleate hydrocarbons in ice [1987, spa] **F-36515**
Spectral analyses of ionospheric and magnetic disturbances [1987, spa] **K-37134**

Bellingshausen Sea
Observations at the Bransfield Strait/Bellingshausen Sea frontal zone in April 1985 [1985, eng] **B-35371**
First Brazilian marine geophysical expedition to Antarctica [1987, por] **E-37208**
Physical and chemical oceanographic work [1987, spa] **J-35888**

Bellingshausen Station
Soil algae at Bellingshausen Station [1984, rus] **B-36999**

Bird, Cape
Foraging movements of Adelie penguins at Cape Bird [1986, eng] **B-35297**

Bird Island
Energy expenditure in adult least auklets and diving petrels during the chick-rearing period [1986, eng] **B-35293**
Foraging energetics of albatrosses at Bird Island [1987, eng] **B-35473**
Reproductive bioenergetics of the antarctic fur seal, *Arctocephalus gazella*. [1985, eng] **B-35522**

Black Coast
Geology of the Black Coast, eastern Palmer Land [1987, eng] **E-36844**
Magnetic anomalies over the Black Coast, Palmer Land [1987, eng] **L-36208**

Black Island
Wind hybrid power system for antarctic Inmarsat link [1986, eng] **G-35636**
Wind power in Antarctica [1987, eng] **G-36583**

Boggs Valley
Takrouna Formation fossils of northern Victoria Land [1986, eng] **E-35911**

Botnneset Peninsula
Explanatory text and geological map of Botnneset, Antarctica [1987, eng] **E-36027**

Bouvet Island
Terrestrial arthropods of Bouvetöya [1986, eng] **B-35494**
Distribution of seabirds in the Bouvet Island area in winter 1982 [1987, rus] **B-36946**
Composition and distribution of phytoplankton near Bouvet Island [1987, eng] **B-37062**
Botany of Bouvetöya [1987, eng] **B-37104**
Use of AWS on Bouvet Island [1986, eng] **I-34675**

Bowers Mountains
Geology of the Bowers Mountains, northern Victoria Land [1986, eng] **E-35904**
Paleomagnetism in the Bowers Mountains, northern Victoria Land [1986, eng] **E-35905**
Terrane boundaries in northern Victoria Land [1987, eng] **E-36547**
Metamorphism and deformation in the Bowers Mountains [1987, eng] **E-36548**

Brabant Island
Species-poor testate rhizopod fauna on Brabant Island [1987, eng] **B-36848**
Joint Services Expedition to Brabant Island, Antarctica, 1984/85 [1987, eng] **D-35772**
Joint Services Expedition to Brabant Island: overwintering in tents in Antarctica [1986, eng] **D-37492**
Palynological study on the Tertiary of King George and Brabant islands [1987, spa] **E-37037**
First antarctic winter in tents: the Joint Services Expedition to Brabant Island. Pt.3 [1987, eng] **G-37187**
First antarctic winter in tents: The Joint Services Expedition to Brabant Island. Pt.1 [1986, eng] **H-37310**
First antarctic winter in tents: The Joint Services Expedition to Brabant Island. Pt.2 [1986, eng] **H-37311**
Joint Services Expedition to Brabant Island, Antarctica: overwintering in tents [1986, eng] **H-37485**

Bransfield Strait
Spring primary productivity and krill in Bransfield Strait [1986, eng] **B-34663**
Krill stock structure and composition in Bransfield Strait [1986, eng] **B-34691**
Zooplankton composition and abundance in Bransfield Strait during SIBEX-2 [1986, spa] **B-35275**
Ichthyoplankton in Bransfield Strait, SIBEX-2, Chile [1986, spa] **B-35276**
Lanternfishes (Family Myctophidae) collected in Bransfield Strait (SIBEX-2, Chile) [1986, spa] **B-35277**
Nutrition and prey size in fish larvae in Bransfield Strait (SIBEX-2, Chile) [1986, spa] **B-35278**
Trophic level of *Pleuragramma antarcticum* in Bransfield Strait and other areas of the Antarctic [1986, spa] **B-35279**
Size fractionation of antarctic phytoplankton [1985, eng] **B-35366**
Observations at the Bransfield Strait/Bellingshausen Sea frontal zone in April 1985 [1985, eng] **B-35371**
Distribution of marine birds and their prey in Bransfield Strait and southern Drake Passage [1985, eng] **B-35380**
Krill population in Drake Passage and Bransfield Strait, Dec. 1983-Jan. 1984 [1986, eng] **B-35599**
Nutrition of *Pleuragramma antarcticum* off Antarctic Peninsula [1987, eng] **B-36123**
Bacteria and phytoplankton in Bransfield Strait and Drake Passage [1987, eng] **B-36210**
Krill population comparisons, 1981 and 1984, near South Shetland Is. [1987, eng] **B-36225**
Summer phytoplankton in Bransfield Strait [1986, eng] **B-36240**
Cytogenetic studies of antarctic fishes, Pt 1 [1986, por] **B-36242**
Histology of retina in fishes from Bransfield Strait [1986, por] **B-36244**
Vertical distribution of krill larvae in Bransfield Strait, 1982-1983 [1986, eng] **B-36245**
Fish from Bransfield Strait, 1983 [1986, eng] **B-36246**
Tintinnina in Bransfield Strait, 1983 [1986, eng] **B-36247**
Primary productivity and phytoplankton standing stock in Bransfield Strait [1986, eng] **B-36248**
Zooplankton composition and abundance in Bransfield Strait, SIBEX-2 [1986, eng] **B-36826**
Ichthyoplankton in Bransfield Strait, SIBEX-2 [1986, eng] **B-36827**
Lanternfishes (family Myctophidae) in Bransfield Strait, SIBEX-2 [1986, eng] **B-36828**
Mesoscale variability in the distribution of krill *Euphausia superba* [1987, eng] **B-36894**
Primary productivity in Bransfield Strait [1987, spa] **B-37038**
Chlorophyll *a* distribution in Bransfield Strait in summer 1985 [1987, spa] **B-37039**
Krill biomass and distribution in Bransfield Strait in summer 1985 [1987, spa] **B-37040**
Sightings of marine mammals during SIBEX-2 in Bransfield Strait and adjacent waters [1987, spa] **B-37044**
Some results on quantitative investigations of macrozoobenthos in the Scotia Arc (Antarctica) [1988, eng] **B-37121**
Nano- and picoplankton in the southern ocean [1987, eng] **B-37156**
Antarctic phytoplankton of the Bransfield Strait and adjacent waters [1987, eng] **B-37390**
Preliminary results from the *USCGC Glacier* 1985 cruise [1985, eng] **E-35335**
Contribution to the study of sediments in the Bransfield Strait region [1987, por] **E-35468**
Geotechnical properties of antarctic deep sea sediments [1985, eng] **E-36444**
First Brazilian marine geophysical expedition to Antarctica [1987, por] **E-37208**
Opal sediments and fluorine chemistry in antarctic waters [1987, eng] **E-37322**
Iceberg sightings during SIBEX-2, Chile, in Bransfield Strait, 1985 [1986, spa] **F-35274**
Iceberg sightings in Bransfield Strait, 1985 [1986, eng] **F-36825**
Water masses and currents off the Antarctic Peninsula [1986, eng] **J-34690**
Residual amino acid fluxes in the upper water column of the Bransfield Strait [1985, eng] **J-34706**
Coprostanols in marine sediments as biomarker for marine mammal pollution [1986, eng] **J-35112**

Bransfield Strait *(cont.)*
Hydrography of Bransfield Strait during SIBEX-2, Chile, summer 1985 [1986, spa] **J-35271**
Micronutrients in Bransfield Strait during SIBEX-2 [1986, spa] **J-35272**
Thermal structure and heat flux in the Bransfield Strait during SIBEX-2, 1985 [1986, spa] **J-35273**
Suspended and deposited sediments in Bransfield Strait [1985, eng] **J-35343**
Biogenic sediments in Atlantic sector antarctic waters [1987, eng] **J-35451**
Bransfield Strait and Drake Passage hydrodynamics, 1983-1984 [1986, eng] **J-35584**
Physical and chemical oceanographic work [1987, spa] **J-35888**
Helium-3 balance of the upper layers of the northwest Weddell Sea [1987, eng] **J-36101**
Environmental parameters of the Bransfield Strait [1986, eng] **J-36251**
Thermal structure of Bransfield Strait and Drake Passage [1986, por] **J-36253**
Planktonic and algal fluxes in Bransfield Strait [1987, eng] **J-36318**
Preliminary observations on the distribution of micronutrients during the *Antártida 8611* cruise (Nov. 1986-Feb. 1987) [1987, spa] **J-36357**
Chlorophyll *a* distribution in the Atlantic sector of the Antarctic in the austral summer 1986-1987, *Antártida 8611* [1987, spa] **J-36358**
Dissolved and particulate lipids in Bransfield Strait, *Antartic' 86* [1987, spa] **J-36362**
Chlorinated hydrocarbons in Bransfield Strait [1987, spa] **J-36365**
Hydrocarbons in Bransfield Strait [1987, spa] **J-36366**
Micronutrients in Bransfield Strait during SIBEX-2 [1986, eng] **J-36823**
Thermal structure and heat fluxes at Bransfield Strait, 1985 [1986, eng] **J-36824**
Diploptene in antarctic sediments [1988, eng] **J-37008**

Breid Bay
Moored Buoy experiment in Breid Bay, Antarctica [1987, jpn] **B-36732**
Chlorophyll *a* in coastal waters [1987, eng] **J-36575**

Brown Station
Effects of cold on circadian rhythm in man [1987, spa] **H-36516**

Brunt Ice Shelf
Quantitative estimates of the mass flux and ice movement along the ice edges in the eastern and southern Weddell Sea [1987, eng] **F-35502**
Movement of Halley, derived from SATNAV measurements 1986-1987 [1988, eng] **F-37118**

Buchanan Bay
Breeding status of birds on George V Coast [1987, eng] **B-36469**

Buckeye Table
Lithofacies and origin of the Buckeye Formation, Ohio Range [1988, eng] **E-37209**

Budd Coast
Methanesulphonate in antarctic ice [1986, eng] **F-35120**

Bull Pass
Cavernous weathering in Bull Pass dolerites [1987, eng] **E-35018**

Bunger Hills
Regional climate of two antarctic oases [1986, eng] **I-36668**

Burton Lake
Ecology of a meromictic lagoon zooplankton [1986, eng] **B-34745**

Byrd Glacier
Finite-element method applied to a time-dependent flowband model [1987, eng] **F-35510**

Byrd Station
Long-term record of H2O2 in polar ice cores [1986, eng] **F-34859**
Grain growth in polar ice: Pts. 1 and 2 [1986, eng] **F-36031**
Isotopic fractionation at the base of polar and sub-polar glaciers [1986, eng] **F-36033**
Behavior of polycrystalline ice [1987, fre] **F-36425**
CO2 record in the Byrd ice core 50,000-5,000 years BP [1988, eng] **F-37215**
Fabrics in polar ice sheets: development and prediction [1988, eng] **F-37250**
Methane concentration in the glacial atmosphere [1988, eng] **F-37323**

Carapace Nunatak
Chemistry of geological samples from Allan Hills and Carapace Nunatak [1986, eng] **E-34780**
Steranes and triterpanes in Beacon Supergroup samples [1987, eng] **E-36404**
Jurassic sequences at Carapace Nunatak and Coombs Hills, Victoria Land [1987, eng] **E-36970**

Casey Station
Casey snow runway data report, 1983-84 [1984, eng] **F-36081**
Casey snow runway tests, 1983-84 [1984, eng] **F-36082**
Casey snow runway meteorological records, 1984 [1987, eng] **I-36083**
Polar cap ionosphere [1987, eng] **K-35978**

Clarence Island
Shipboard observations of a giant iceberg near Clarence I. [1987, eng] **F-36465**

Cloudmaker, The
Silurian marine fauna not confirmed from Antarctica [1987, eng] **E-36402**

Commonwealth Bay
Breeding status of birds on George V Coast [1987, eng] **B-36469**
Project Blizzard 1985/86 [1986, eng] **D-34736**

Coombs Hills
Jurassic sequences at Carapace Nunatak and Coombs Hills, Victoria Land [1987, eng] **E-36970**

Crary Ice Rise
Glaciogeophysical survey of the Ross Embayment, 1984-1985 [1985, eng] **F-35193**

Croker Passage
Zooplankton community of Croker Passage, Antarctic Peninsula [1985, eng] **B-34831**
Midwater food web in McMurdo Sound [1987, eng] **B-36865**

Crozet Islands
New Trichotropidae gastropods from Kerguelen and Crozet Islands [1986, eng] **B-34753**
Subantarctic freshwater [1983, eng] **B-34876**
Bothidae (Pisces: Pleuronectoidei) from Crozet Islands [1986, fr] **B-35853**
Longevity, reproduction and competition in two subantarctic beetles [1987, eng] **B-36099**
Two sibling species of the *Tigriopus angulatus* group from Crozet and Kerguelen Is. [1987, fre] **B-36108**
Feeding of seabirds and killer whales at Crozet Is. [1987, eng] **B-36401**
New species of Harpacticoid Copepod from Crozet Is. [1986, fre] **B-36561**
Biology of *Lithodes murrayi* from Crozet Is. [1987, fre] **B-36789**
Subantarctic fur seal *Arctocephalus tropicalis* in French subantarctic territories [1987, eng] **B-37302**
Environmental modification of subantarctic peat bog by albatrosses [1987, eng] **E-36699**

Dakshin Gangotri Station
Study of Dakshin Gangotri ice-shelf [1986, eng] **F-36759**
Site selection for structures on a floating ice shelf, Antarctica [1986, eng] **G-34678**
Structures on a floating ice shelf in Antarctica [1986, eng] **G-35054**
Dakshin Gangotri: the Indian permanent station in Antarctica [1986, eng] **G-36741**
Meteorological studies at Dakshin Gangotri, Mar. 1984 to Feb. 1985 [1986, eng] **I-36743**
Ionized and non-ionized atmosphere at Dakshin Gangotri Station [1986, eng] **I-36760**

Danco Coast
Summer marine environmental parameters in West Antarctica [1986, spa] **B-35863**
Preliminary characterization of organic soil under gramineae [1987, spa] **B-36727**

Daniels Range
Geology of the Daniels Range, northern Victoria Land [1986, eng] **E-35902**
Age and ancestry of metamorphic rocks of the Daniels Range, USARP Mountains, Antarctica [1986, eng] **E-35903**

Davis Sea
Hydrological observations in the Davis Sea in the POLEX-South program [1986, rus] **J-36230**

Davis Station
Food of the South Polar Skua near Davis Station [1986, eng] **B-34667**
Inshore seasonal changes in diatoms near Davis Station [1986, eng] **B-34683**
Epiphytic diatoms of the inshore marine area near Davis Station [1986, eng] **B-34744**
Seasonal variation in phytoplankton and ice algae in shallow coast site [1987, eng] **B-35867**
Sea ice measurements at Davis Station [1986, chi] **F-34767**
Occupational health among ANARE wintering personnel [1987, eng] **H-35453**

Australian upper atmospheric and space research, 1987 [1987, eng] K-35955
Pc3 magnetic pulsations at Davis [1987, eng] K-35956
Morphology of the midday radio aurora in the Southern Hemisphere [1987, eng] K-35960
OH nightglow and temperature at Davis [1987, eng] K-35969
"Serpentine emission" at Davis Station [1987, eng] K-36107
Distribution of aurora irregularities over the southern polar cap [1986, eng] K-36445
Pc3 magnetic pulsations at Davis, Antarctica [1987, eng] K-37051
Effects of magnetic activity and the IMF on southern polar radio aurorae [1988, eng] K-37513

Deception Island
Morphometrics of an antarctic maritime mite [1986, eng] B-35092
Distribution of *Euphausia crystallorophias* [1987, eng] B-36693
Taxonomy of freshwater crustaceans on Deception I. [1987, spa] B-36726
Eruption mechanism of recent volcanic activity on Deception Island [1987, spa] E-36375
Preliminary study of fumarolic activity on Deception Island [1987, spa] E-36376
Anomalous character of recent volcanism in the South Shetland Islands [1987, spa] E-37035
Morphology and origin of lentic environments on Deception I. [1987, eng] E-37405
Chemistry of lentic environments on Deception I. [1987, eng] E-37406
Development of geophysical instrumentation to operate in antarctic conditions [1987, spa] L-36373
Preliminary study of seismic activity on Deception Island [1987, spa] L-36374

Deep Lake
Effect of temperature on the growth rates of halotolerant and halophilic bacteria isolated from antarctic saline lakes [1988, eng] B-37125

Denison, Cape
Historical archaeology at Cape Denison, Commonwealth Bay, Antarctica [1988, eng] A-37294

Dome C
Long-term climatic changes indicated by crystal growth in polar ice [1987, eng] F-35244
Two Be-10 peak depositions in ice during last glaciation [1987, eng] F-35322
Grain growth in polar ice: Pts. 1 and 2 [1986, eng] F-36031
Crystalline fabric of polar ice sheets inferred from seismic anisotropy [1987, eng] F-36285
Ice sheet elevation changes from isotope profiles [1987, eng] F-36289
Behavior of polycrystalline ice [1987, fre] F-36425
Firn densification by grain-boundary sliding: a first model [1987, eng] F-36773

Drake Passage
Size fractionation of antarctic phytoplankton [1985, eng] B-35366
Distribution of marine birds and their prey in Bransfield Strait and southern Drake Passage [1985, eng] B-35380
Krill population in Drake Passage and Bransfield Strait, Dec. 1983-Jan. 1984 [1986, eng] B-35599
Macroplankton zoogeography and community analysis [1987, ger] B-35851
Bacteria and phytoplankton in Bransfield Strait and Drake Passage [1987, eng] B-36210
Nano- and picoplankton in the southern ocean [1987, eng] B-37156
Drake Passage/Western Scotia Sea [1986, eng] B-37252
Antarctic phytoplankton of the Bransfield Strait and adjacent waters [1987, eng] B-37390
Preliminary report on atmospheric radon over the Antarctic Peninsula [1986, eng] I-36256
Biogenic sulfur from the subantarctic and antarctic oceans [1987, eng] I-36612
Characteristics of intense antarctic depressions near the Drake Passage. [1983, eng] I-36657
Biogenic sediments in Atlantic sector antarctic waters [1987, eng] J-35451
Bransfield Strait and Drake Passage hydrodynamics, 1983-1984 [1986, eng] J-35584
Water masses and currents of the southern ocean [1987, eng] J-35684
Physical and chemical oceanographic work [1987, spa] J-35888
Thermal structure of Bransfield Strait and Drake Passage [1986, por] J-36253
Numerical study of the response of the southern ocean and its sea ice to a CO2-induced atmospheric warming [1986, eng] J-37309

Druzhnaya Station
Soviet research station disappears [1986, fre] G-34950

Dufek Massif
Sulfide mineral distribution in the Dufek intrusion [1985, eng] E-35186

Dumont d'Urville Station
Protein and lipid utilization during long-term fasting in emperor penguins [1988, eng] B-37211
Anthropogenic and natural lead in antarctic snow [1987, eng] F-36163
Human sleep patterns in Antarctica [1987, eng] H-36181
Auroral occurrence from 1963 to 1970 as observed at Dumont d'Urville Station [1986, eng] K-37277

East Antarctica
Carbon, nitrogen and phosphorus in a desert moss community soil system [1986, eng] B-35645
Distribution of nitrogen in moss communities in East Antarctica [1986, eng] B-35679
Biological properties and distribution of krill in East Antarctica [1987, rus] B-36281
Heterococcus morphological changes and response to temperature [1987, eng] B-36957
Rayner Complex of East Antarctica: complex isotopic systematics within a Proterozoic mobile belt [1987, eng] E-35106
Geology and origin of the Elephant Moraine on the east antarctic ice sheet [1985, eng] E-35160
Thermoluminescence of sandstone clasts of the Elephant Moraine [1985, eng] E-35161
Tectonics of West Antarctica and its relation to East Antarctica: USARP-BAS geology/geophysics project (1984-1985) [1985, eng] E-35177
Hydrochemical data for paleohydrological reconstruction of deep nondraining lakes of East Antarctica [1987, rus] E-36943
Biogenic facies in the antarctic glacimarine environment [1988, eng] E-37112
Glacier thickness and velocity measurements [1986, rus] F-34719
Aerosol concentrations over the last climatic cycle (160 kyr) from an antarctic ice core [1987, eng] F-35127
Seasonal variations of east antarctic sea ice [1987, eng] F-36072
Climatic warming and basal melting of large ice sheets [1987, eng] I-35328
Near-surface wind speed in winter [1986, eng] I-35822
Air density and variability in lower stratosphere over East Antarctica [1986, eng] I-35836
Aerosol optical depth measurements in summer 1984-1985 [1987, eng] I-36646
Analysis of katabatic winds [1986, eng] I-36665
Homogeneous group processes controlling early cold and late warm autumn in East Antarctica [1984, rus] I-37001
Synoptic conditions in exceptionally warm weather in East Antarctica in summer 1973-1974 [1986, rus] I-37028
Unfavorable meteorological conditions for flights over East Antarctica during the warm season [1988, rus] I-37421
Spectral characteristics of magnetic Pi 2 pulsations [1981, eng] K-36918
Earthquakes in continental Antarctica [1986, eng] L-35035

East Ongul Island
Nitrogen fixation in moss from East Ongul I. [1987, eng] B-36771
Studies on algae from inland waters on East Ongul I. [1987, eng] B-37468

Ekström Ice Shelf
45 m mast for boundary layer meteorological research, Ekström Ice Shelf [1987, eng] I-35280
Tidal spectrum underneath antarctic ice shelves [1986, eng] J-34896
Tidal movement measurements under Ekström Ice Shelf [1987, ger] J-36186

Elephant Island
Fisheries research in the Antarctic [1986, ger] A-36584
Zooplankton abundance changes around Elephant Island [1986, eng] B-34692
Phytoplankton and krill abundance around Elephant Island [1986, eng] B-34693
Distribution and stock of krill around Elephant Island, 1983-1985 [1986, eng] B-34694
Fish stock in the Scotia arc region during SIBEX [1986, eng] B-34695
Differences between krill swarms and implications for population sampling [1986, eng] B-34835

Elephant Island *(cont.)*
Structure and composition of a large krill swarm at Elephant Island [1984, eng] **B-34846**
Vertical distribution and abundances of zooplankton in the vicinity of Elephant Island [1985, eng] **B-35372**
Extraction and measurements of adenosine triphosphate in water [1987, eng] **B-35716**
Krill population comparisons, 1981 and 1984, near South Shetland Is. [1987, eng] **B-36225**
Euphausiid populations off Elephant I., Mar. 1984 [1987, eng] **B-36226**
Fatty acids and sterols in the amphipod *Themisto gaudichaudii* Guerin 1828 [1988, eng] **B-36801**
Nano- and picoplankton in the southern ocean [1987, eng] **B-37156**
Geology of Elephant I. [1986, por] **E-36254**

Ellis Fjord
Heliozoean genera *Pinaciophora* and *Acanthocystis* from Ellis Fjord [1987, eng] **B-36695**
Macrobenthic species assemblages in Ellis Fjord [1988, eng] **B-37378**
Loricate choanoflagellates from Ellis Fjord [1987, eng] **B-37452**
Three new zooplankton nets for under-ice sampling [1987, eng] **B-37461**

Ellsworth Land
Geologic studies in the English Coast, eastern Ellsworth Land, Antarctica [1985, eng] **E-35174**
Tertiary mafic volcanic and volcaniclastic rocks of the English Coast, Antarctica [1985, eng] **E-35175**
Sedimentary rocks of the English Coast, eastern Ellsworth Land, Antarctica [1985, eng] **E-35176**

Ellsworth Mountains
New data on Upper Cambrian fauna of Ellsworth and Pensacola Mountains [1984, rus] **E-35076**
Plant fossils from the Ellsworth Mountains [1985, eng] **E-35184**
Volume on geology of the Ellsworth Mountains—progress in 1984-1985 [1985, eng] **E-35185**
Sedimentary rocks of the Ellsworth-Thiel Mountains ridge and their regional equivalents [1987, eng] **E-36209**
Force balance of Rutford Ice Stream, Antarctica [1987, eng] **F-36291**

Enderby Land
Euphausia crystallorophias from Enderby Land and ontogeny of neritic euphausiids [1987, eng] **B-35612**
Krill behavior under sea ice, spring 1985 [1987, eng] **B-36306**
Geochronology, structure and metamorphism in Archaean rocks in Enderby Land [1983, eng] **E-35133**
Origin and evolution of granulites in normal and thickened crusts [1987, eng] **E-35489**
Balance of Sm-Nd whole-rock systems of Enderby Land [1987, eng] **E-36313**
Wollastonite and scapolite in Precambrian calc-silicate granulites [1987, eng] **E-36314**
Corundum+quartz association in rocks from Enderby Land [1987, eng] **E-36711**
Bedrock topography of Enderby and Mac. Robertson lands [1987, rus] **E-36934**

English Coast
Sedimentary rocks of the English Coast [1987, eng] **E-35796**

Erebus Glacier Tongue
Simulation of Erebus Glacier Tongue thermal regime [1986, eng] **F-36036**

Erebus, Mount
Thermophilic heterotrophs in geothermally heated soils from Mount Erebus [1988, eng] **B-37181**
Earthquake swarms on Mount Erebus, Antarctica [1986, eng] **E-35044**
Eruption of Mount Erebus and Ross Island seismicity, 1984-1985 [1985, eng] **E-35169**
Seismic activity of Mount Erebus in 1984-1985 [1987, eng] **E-36702**
Volcanic geology of Mount Erebus, Ross Island, Antarctica [1987, eng] **E-36707**
Microstructure of calcic anorthoclase from Mount Erebus [1987, eng] **E-36708**
Volcanic glass and Ca-rich anorthoclase from Mt. Erebus, Antarctica [1988, ger] **E-37212**
Particles in the Mt. Erebus volcanic plume, 1983 [1986, eng] **I-36886**
Geophysical studies on Mount Erebus [1985, eng] **L-35170**
Gravity survey in Ross Island [1987, eng] **L-36703**

Evans, Cape
C-14 ages of early 20th century animal remains at Cape Evans [1986, eng] **B-35298**

Explorers Cove
Foraminiferal biotopes in Explorers Cove, McMurdo Sound, Antarctica [1987, eng] **B-36480**

Exposure Hill
Exposure Hill Formation, Mesa Range [1986, eng] **E-35913**

Falkland Islands
Falkland fishing limits [1987, eng] **A-36218**
Pasture improvement studies in the Falkland Islands [1987, eng] **A-37264**
Habitat and distribution of Falkland Islands mosses [1986, spa] **B-34686**
Some pelagic larvae of Anthozoa (Coelenterata) [1982, spa] **B-34796**
Distribution and relationships of South American skuas [1978, eng] **B-34849**
Cortaderia pilosa (Gramineae) in Falkland Islands [1986, eng] **B-35034**
Key to *Pentamyzus* Hille Ris Lambers and new species from Falkland Is. [1987, eng] **B-35049**
Ampelisca macrodonta n.sp. from Falkland Is. [1987, eng] **B-35488**
Intestinal anatomy and histology in notothenioids [1986, eng] **B-35752**
Ornamentation changes on carapaces of Falkland Island crabs [1987, eng] **B-36015**
Morphology of a fresh water molluscan of the Falkland Islands [1987, eng] **B-36206**
Chemical composition and digestibility of *Poa flabellata (Tusac),* from the Falkland Islands [1986, spa] **B-37084**
Taxonomy of *Carex* sect. *Abditispicae* sect. nov. (Cyperaceae) from austral South America [1987, eng] **B-37086**
Nature on Falkland Islands [1987, swe] **B-37151**
Porifera (Demospongiae) collected on the B/I *Dr. E. Holmberg* cruise [1986, spa] **B-37213**
Falklands' Johnny rook [1986, eng] **B-37418**
Status and conservation of seabirds at the Falkland Islands [1984, eng] **B-37424**
Tree planting in the Falkland Islands [1986, eng] **B-37477**
Identity of *Chonetes falklandicus* (Brachiopoda, Devonian) [1987, eng] **E-36953**
Britain's antarctic dimension [1983, eng] **M-35236**

Faraday Station
Physical fitness and training programs on an antarctic base [1985, eng] **H-37020**
Recent measurements of antarctic ozone depletion [1986, eng] **I-34954**
IHW Island Network [1987, eng] **K-36106**
Whistler signals at Faraday Station [1987, eng] **K-36640**

Ferraz Station
Contribution to the study of sediments in the Bransfield Strait region [1987, por] **E-35468**
Container modules as living and working quarters at Ferraz Station [1986, eng] **G-36259**

Filchner Ice Shelf
Expedition ANTARKTIS-IV of RV *Polarstern* 1985/86. Report of Legs ANT-IV/3-4 [1987, ger] **D-37493**
Quantitative estimates of the mass flux and ice movement along the ice edges in the eastern and southern Weddell Sea [1987, eng] **F-35502**
Coastline changes revealed by satellite imagery [1987, eng] **F-35774**
On the draughts of some large antarctic icebergs [1987, eng] **F-36464**
Soviet research station disappears [1986, fre] **G-34950**
Meteorological conditions at Druzhnaya Base in summer 1980 [1986, rus] **I-36197**

Filchner Station
Deformation of snow and ice at German antarctic stations [1984, ger] **F-34727**

Fildes Peninsula
Natural environment and human factors on King George I. [1987, kor] **A-36500**
New organ species in Lower Tertiary tafoflora from Fildes Peninsula [1986, spa] **E-35261**
Fossil plants from Fildes Peninsula [1986, por] **E-36249**
Palynology and paleoecology of Fildes Peninsula [1986, por] **E-36252**

Fimbul Ice Shelf
Radar altimetry delineates ice shelf boundaries and elevations [1987, eng] **C-36080**

Flatvaer Islands
Ultramafic granulites in the Flatvaer Islands region [1986, eng] **E-34776**
Natural remanent magnetism of Flatvaer Islands rocks [1986, eng] **L-34773**

Forrestal Range
Sulfide mineral distribution in the Dufek intrusion [1985, eng] **E-35186**
Fossil Bluff
Biostratigraphy of Fossil Bluff, Alexander Island [1988, eng] **E-37113**
Framnes Mountains
Crystallography of Patterned Lake, Framnes Mountains [1986, eng] **F-36035**
Fremouw Peak
Vesicular-arbuscular mycorrhizae from the Triassic of Antarctica [1987, eng] **E-37210**
Fryxell, Lake
Unusual strain of *Desulfovibrio* sp. from an antarctic lake [1986, eng] **B-35123**
Photosynthate distribution by microplankton in permanently ice-covered antarctic desert lakes [1987, eng] **B-35325**
Georg von Neumayer Station
Deformation of snow and ice at German antarctic stations [1984, ger] **F-34727**
45 m mast for boundary layer meteorological research, Ekström Ice Shelf [1987, eng] **I-35280**
C-13/C-12 ratios at Georg von Neumayer Station [1987, eng] **I-35476**
Meteorological data of the Georg von Neumayer Station for 1983 and 1984 [1987, eng] **I-36983**
Tidal movement measurements under Ekström Ice Shelf [1987, ger] **J-36186**
George V Coast
Breeding status of birds on George V Coast [1987, eng] **B-36469**
Geology of sediment cores offshore from George V Land [1987, eng] **E-36093**
George VI Ice Shelf
Seismic bedrock depth measurements and the origin of George VI Sound, Antarctic Peninsula [1987, eng] **E-35766**
Tidal spectrum underneath antarctic ice shelves [1986, eng] **J-34896**
George VI Sound
Glacial history of the Antarctic Peninsula and South Georgia [1986, eng] **E-35255**
Gerlache Strait
Whale sightings in the bays off Gerlache Strait [1988, eng] **B-36976**
Geological formations and mineral occurrence in southern Gerlache Strait [1986, spa] **E-35260**
Gjelsvik Mountains
Botany of the Mühlig-Hofmann and Gjelsvik Mountains, Part 1 [1986, eng] **B-35492**
Gorgon Peak
Paleomagnetism and hydrothermal alteration: Kirkpatrick Basalt Group, Victoria Land [1985, eng] **L-35172**
Gough Island
Alien plants on Gough Island [1986, eng] **B-35518**
Subantarctic fur seal *Arctocephalus tropicalis,* at Gough Island (Tristan da Cunha group) [1987, eng] **B-37300**
Bird populations at PEI and Gough Island, 1951-1986 [1987, eng] **B-37349**
Volcanism on Gough Island: a revised stratigraphy [1988, eng] **E-37261**
Granite Harbor
Rb-Sr mineral and whole rock dates for I-type granitoids [1987, eng] **E-36862**
Sea ice operation: McMurdo Sound-Granite Harbour [1986, eng] **F-35296**
Great Wall Station
Tunicates in Great Wall Bay [1987, chi] **B-37096**
Snow blizzard in summertime—random notes on observations in Antarctica [1980, chi] **D-35883**
Whistler observations at Great Wall Station [1987, eng] **K-36063**
Guettard Range
Geology of the Hutton Mountains and the Guettard Range [1987, ger] **E-36777**
Half Moon Island
Geology of the plutovolcanic complex on Half Moon I. [1987, spa] **E-37034**
Halley Station
Movement of Halley, derived from SATNAV measurements 1986-1987 [1988, eng] **F-37118**
Sleep and melatonin rhythms in winter [1986, eng] **H-34704**
Staphylococcus aureus in Antarctica: carriage and attempted eradication [1986, eng] **H-35067**
Recent measurements of antarctic ozone depletion [1986, eng] **I-34954**
Green flash in Antarctica, April 1985 [1987, eng] **I-35756**
Internal gravity wave in lower troposphere at Halley Station [1987, eng] **I-36116**
Propagation of internal gravity waves in the stably stratified atmospheric boundary layer [1987, eng] **I-37090**
Observations of the effects of DPY currents at sub-auroral latitudes [1986, eng] **K-34682**
Poleward edge of the mid-latitude electron density trough [1986, eng] **K-34710**
Siple VLF transmitter probes ionosphere and magnetosphere [1985, eng] **K-35555**
Simultaneous ionospheric data from Siple and Halley Stations [1985, eng] **K-35560**
AVDAS, a microcomputer-based system [1987, eng] **K-35762**
ULF/VLF correlator experiment at Halley [1987, eng] **K-35763**
Riometer measurements of electron precipitation [1986, eng] **K-36193**
Atmospheric studies by optical methods [1987, eng] **K-36518**
Comparison of gorund-based ionospheric measurements and the USU ionospheric model [1987, eng] **K-36647**
Studies of standing-wave geomagnetic pulsations in the magnetosphere [1987, eng] **K-36843**
Thermospheric wind response to driving forces in the vicinity of the Harang discontinuity [1988, eng] **K-37473**
Heard Island
Distribution and composition of vascular plant communities on Heard Island [1987, eng] **B-35617**
Contrasts in vegetation pattern: Heard Island and Macquarie Island [1987, eng] **B-37362**
Characteristics of Kerguelen and Heard islands coastal waters in relation to phytoplankton growth [1987, eng] **J-36785**
Hoare, Lake
Microorganism adaptation to high oxygen in oligotrophic lake [1984, eng] **B-35424**
Applied and environmental microbiology [1986, eng] **B-35427**
Spectral downwelling irradiance in an antarctic lake [1987, eng] **B-35616**
Perennial N2 supersaturation in an antarctic lake [1987, eng] **E-35128**
Sedimentation in ice-covered Lake Hoare, Antarctica [1987, eng] **E-36952**
Holyoake Range
Byrd Group of the Holyoake Range, central Transantarctic Mountains [1985, eng] **E-35155**
Hope Bay
Revision of the early Cretaceous flora from Hope Bay, Antarctica [1987, eng] **E-36796**
Hutton Mountains
Geology of the Hutton Mountains and the Guettard Range [1987, ger] **E-36777**
Indian Ocean
Phytoplankton in the Indian Ocean [1986, eng] **B-34664**
Age, growth and reproduction of *Notothenia squamifrons* Gunther in Indian Ocean [1985, eng] **B-34829**
Helminthofauna in Nototheniidae from the Indian Ocean [1986, rus] **B-35096**
Light penetration and primary productivity in the Indian Ocean [1987, fre] **B-35225**
Phytoplankton communities in the Indian Ocean at the end of summer [1987, fre] **B-35226**
Biochemistry of organic particulate matter in the Indian Ocean in 1984 [1987, fre] **B-35227**
Phytoplankton carboxylase metabolism and C-13/C-12 ratio of organic carbon, 1984 [1987, fre] **B-35228**
Growth and physicochemical parameters of diatoms [1987, fre] **B-35229**
Preliminary data on seabird distribution in the southwestern Indian Ocean [1987, fre] **B-35230**
Size fractionation of antarctic phytoplankton [1985, eng] **B-35366**
Characteristics of the Kerguelen marbled notothenia, *Notothenia rossi rossi* [1986, eng] **B-35411**
Distribution of *Microvibrio marinus* in Indian Ocean [1987, fre] **B-36688**
Transfer functions between diatom assemblages and surface hydrology in the southern ocean [1987, eng] **B-36689**
Feeding behavior of three species of southern albatross [1988, eng] **B-37138**

Indian Ocean *(cont.)*
BIOMASS Data Analysis Workshop on Antarctic Phytoplankton/Zooplankton Relationships [1988, eng] **B-37379**
Recent radiolarian genus *Antarctissa* from the Indian Ocean [1986, eng] **E-34925**
Sediment description and biostratigraphic data [1987, fre] **E-35231**
Nature and age of the Kerguelen-Heard Plateau [1987, fre] **E-35426**
Southern ocean drilling: the South Atlantic and Indian Ocean sectors [1987, eng] **E-35776**
Seismic stratigraphy and evolution of the Raggatt Basin, southern Kerguelen Plateau [1988, eng] **E-37111**
Sedimentary phosphate occurrence on the Kerguelen-Heard Plateau [1986, fre] **E-37159**
Lower Cretaceous basalt and sediments from the Kerguelen Plateau [1987, eng] **E-37259**
Indian Ocean [1988, rus] **E-37521**
Neutron-activation determination of atmospheric microelements in Antarctica and the Indian Ocean [1987, rus] **I-35813**
Large-scale dynamics of the subantarctic atmosphere [1986, rus] **I-37230**
MD38/Apsara 2—Antiprod 3 on board the *Marion Dufresne* Jan. 16-Feb. 22, 1984 [1987, fre] **J-35220**
Biology, chemistry and sedimentology of the Kerguelen Plateau during Apsara 2 and Antiprod 3, Jan.-Feb. 1984 [1987, fre] **J-35221**
Physical and chemical properties of the Indian Ocean water masses south of the polar front [1987, fre] **J-35222**
Copper, manganese and cadmium in the antarctic sector of the Indian Ocean [1987, fre] **J-35223**
Nutrient salt concentrations of surface water in the Indian Ocean [1987, fre] **J-35224**
Hydrography and circulation of the Indian Ocean [1985, eng] **J-35441**
Indian Ocean seasonal circulation patterns [1987, eng] **J-36533**
Hydrochemical studies in the southern Indian Ocean by SAE 22 [1987, eng] **J-37061**
Anomalous heat flow near the Crozet Plateau and mantle convection [1986, eng] **L-34949**
Bathymetry and magnetism [1987, fre] **L-35232**

Inexpressible Island
Katabatic wind interaction with Inexpressible Island, Terra Nova Bay [1985, eng] **I-35532**

James Ross Island
Palynology progress, James Ross Island basin [1985, eng] **E-35181**
Submarine trace fossils off James Ross Island [1987, eng] **E-35314**
Orientated calcareous concentrations from James Ross Island, Antarctica [1987, eng] **E-35765**
Revision of the Marambio Group, James Ross Island, Antarctica [1986, eng] **E-35862**
Proglacial delta front, reworked tuffs, James Ross Island area [1987, eng] **E-36837**
Drumlins and drumlinoid forms on James Ross I. [1987, eng] **E-37268**
"Whiskey Glacier" on James Ross I. [1987, eng] **F-36907**
Accumulation and temperature of the James Ross I. ice cover [1987, eng] **F-36910**

Jetty Peninsula
Field studies Jetty Peninsula with the 30th SAE [1985, eng] **E-35187**

Kerguelen Islands
New Trichotropidae gastropods from Kerguelen and Crozet Islands [1986, eng] **B-34753**
Summer diet of Commerson dolphin from Kerguelen Islands [1984, fre] **B-34758**
Biochemistry of *Durvillaea antarctica* at Kerguelen [1986, eng] **B-34820**
Subantarctic freshwater [1983, eng] **B-34876**
Genetic differentiation of two mussels from Kerguelen Islands [1987, eng] **B-34916**
Adaptive significance of size and pigmentation of an isolated population of the subantarctic dolphin *Cephalorhynchus commersonii* (Lacépède, 1804) [1986, fre] **B-35240**
Carbonic anhydrase in 2 Kerguelen fishes, one hemoglobin-free, the other of normal blood [1981, fre] **B-35387**
Freshwater diatoms from Kerguelen Islands, excluding Monoraphideae [1986, fre] **B-35407**
Characteristics of the Kerguelen marbled notothenia, *Notothenia rossi rossi* [1986, eng] **B-35411**
Abundance distribution models in study of subantarctic lake zooplankton [1985, fre] **B-35425**
Insects of Marion and Prince Edward Islands [1986, eng] **B-35496**
Variability in vegetative and reproductive biomass in *Acaena adscendens* Vahl. (Rosaceae) at Kerguelen (South Indian Ocean) [1985, eng] **B-35527**
Biomass of *Curvillea antarctica* (Cham.) Hariot (Phaeophyceae) in the Bay of Morbihan, Kerguelen Island (South Indian Ocean) [1985, eng] **B-35528**
Identity of *Drepanocladus fontinaliopsis* [1986, eng] **B-35593**
Karyotypes of two populations of the genus *Tisbe* from Kerguelen Is. [1986, fre] **B-35608**
Two sibling species of the *Tigriopus angulatus* group from Crozet and Kerguelen Is. [1987, fre] **B-36108**
Coastal seawater bacteria and avifauna [1987, eng] **B-36698**
Humic substances resulting from decay of aquatic plants [1987, eng] **B-36772**
Seasonal dynamics of subantarctic marine heterotrophic microflora [1987, fre] **B-36786**
Data on the ecology of Commerson's dolphin from Kerguelen Islands [1987, fre] **B-36787**
Reproduction of Nototheniidae and Channichthyidae from Kerguelen Islands [1987, fre] **B-36790**
Biochemistry of echinoderms [1987, fre] **B-36791**
Feeding behavior of three species of southern albatross [1988, eng] **B-37138**
Vascular flora and vegetation of Ile de Croy, Iles Kerguelen [1988, eng] **B-37295**
Numerical taxonomy of bacterial communities associated with a subantarctic mussel bed [1987, eng] **B-37340**
Adaptive strategy of littoral mites from Kerguelen Is. [1987, fre] **B-37358**
Population structure of littoral mites from Kerguelen Is. [1987, fre] **B-37368**
Comparison of populations of Diptera from Kerguelen Is. [1987, fre] **B-37369**
Structure of the Kerguelen Plateau province [1986, eng] **E-34838**
Uranium and thorium behavior in the Kerguelen alkaline lavas [1984, fre] **E-35707**
Plutonic massif of Val Gabbro (Kerguelen Is.), a tholeiitic complex related to the activity of the East-Indian paleoridge [1984, fre] **E-35708**
From lava to plutonic rocks. The example of Mount Ross, Kerguelen Islands [1988, fre] **E-37338**
Autumn circulation restructuring of subantarctic stratosphere and mesosphere [1986, eng] **I-35839**
Winter variation statistics of antarctic upper air meteorological parameters [1987, rus] **I-36927**
Characteristics of Kerguelen and Heard islands coastal waters in relation to phytoplankton growth [1987, eng] **J-36785**
Effect of the winter D region anomaly on measurements on Kerguelen Island [1983, eng] **K-35302**
Fluctuations of cosmic rays during periods of disturbances [1987, eng] **K-37239**
Seismic refraction experiments on deep structure of Kerguelen Ridge [1983, fre] **L-35706**

King George Island
Natural environment and human factors on King George I. [1987, kor] **A-36500**
Determination of penguins' foraging behavior by radiotelemetry [1986, eng] **B-34818**
Changes of non-protein nitrogens fractions in krill during storage [1986, eng] **B-35290**
Population studies of Adélie, gentoo, and chinstrap penguins [1985, eng] **B-35381**
Breeding cycle in Wilson's storm petrels at King George I. [1986, eng] **B-35597**
Carotenoids in lichens [1986, eng] **B-35603**
Bryum dichotomum Hedw., a species new to the Antarctic [1986, eng] **B-35646**
Ceratodon species collected on King George I. [1986, eng] **B-35648**
Ecological segregation of Adélie, Gentoo, and Chinstrap penguins at King George I. [1987, eng] **B-35846**
Chemical and taxonomic study of antarctic organisms [1987, spa] **B-36363**
Carbon-14 investigations on petrel breeding places [1987, ger] **B-36767**
Investigation of an antarctic grass on King George Island [1987, ger] **B-36768**
Skuas—antarctic predatory gulls [1987, ger] **B-36807**
Pollen and spores transport into the Antarctic [1988, eng] **B-36818**
Mesoscale variability in the distribution of krill *Euphausia superba* [1987, eng] **B-36894**

Study of sea algae in the King George I. coastal area, near Bellingshausen Station [1984, rus] B-37000
Silverfish inflammatory response to plerocercoid infestation [1987, eng] B-37052
Ornithofauna of Fildes Peninsula [1987, rus] B-37073
Rotifers of the genus *Brachionus,* new for Antarctica [1987, spa] B-37135
Polychlorinated biphenyls in marine migratory birds on King George I. [1987, eng] B-37173
Chlorinated hydrocarbons in adipose tissue of seals [1987, eng] B-37174
Six *Coccidiomorpha* n. sp. on seals from King George I. [1987, eng] B-37254
Avifauna of Fildes Peninsula [1987, eng] B-37487
Topographic survey of the South Shetland Islands [1987, spa] C-35889
Oligocene age of *Pecten* conglomerate on King George I. [1986, eng] E-34824
K-Ar ages of Jurassic volcanics and Andean intrusions of King George Island [1982, eng] E-34940
Late Cretaceous-Late Oligocene K-Ar ages of King George I. Supergroup [1982, eng] E-35140
Polish paleontological investigations in West Antarctica, 1986 [1986, pol] E-36039
Polish geological investigations on King George Island in summer 1985-1986 [1986, pol] E-36040
Paleolimnological and geomorphological investigations on King George Island, 1984-1986 [1986, pol] E-36041
Fluorine in ornithogenic soils and minerals on King George I. [1987, eng] E-36124
Paleontological studies on King George I., 1986 [1987, eng] E-36126
Early Miocene foraminiferal zonation, southeast Pacific basin, Antarctic [1987, eng] E-36615
Weathering of volcanic rocks on King George I. [1986, ger] E-36989
Palynological study on the Tertiary of King George and Brabant islands [1987, spa] E-37037
Chemical data on soil samples from King George Island [1987, spa] E-37041
Levels of radioactive precipitation on King George Island [1987, por] I-36739

Kraul Mountains
Age and geotectonic position of igneous rocks in the Kraul Mountains [1984, rus] E-35075

Krok Fjord
Ecology of a meromictic lagoon zooplankton [1986, eng] B-34745

La Gorce Mountains
Sedimentology of the La Gorce Formation [1986, eng] E-34564

Labyrinth
Total organic carbon in ponds of the Labyrinth [1987, eng] B-37480

Lambert Glacier
Antarctic ice sheet configuration 30 deg E to 80 deg E [1986, eng] C-34769
Geological structures in the mountains around Lambert Glacier [1978, ger] E-35031
Bedrock topography of Enderby and Mac. Robertson lands [1987, rus] E-36934
Westward moving disturbances in the Mawson-Davis area [1987, eng] I-37234

Langhovde Hills
Biochemical studies of algae: detection of ferredoxin [1986, eng] B-35673

Langnes Fjord
Annual and diurnal variations in the underwater vocalizations of Weddell seals [1988, eng] B-36815
Do Weddell seals sing [1988, eng] B-36816

Larsen Ice Shelf
Coastline changes revealed by satellite imagery [1987, eng] F-35774
On the draughts of some large antarctic icebergs [1987, eng] F-36464

Lassiter Coast
Geology of portions of the Lassiter and Orville Coasts [1987, ger] E-36776

Law Dome
Fabrics of Law Dome ice cores [1988, eng] F-37245

LeMay Range
Structural history of the LeMay Range [1987, eng] E-36839

Lena Passage
Unloading of a large tanker near Mirnyy Station [1986, rus] G-34717

Leningradskaya Station
Ice conditions for *Mikhail Somov* in Balleny ice massif area [1986, rus] F-36229

Leopold and Astrid Coast
Food of the Cape Pigeon from Princess Elizabeth Land [1986, eng] B-35019

Livingston Island
Early 19th century sealers' refuges on Livingston Island [1987, eng] A-35318
Morphometrics of an antarctic maritime mite [1986, eng] B-35092
Triassic flora on Livingston Island [1987, fre] E-35465
Significant additions to the Upper Triassic flora of Williams Point, Livingston Island, South Shetland Islands (Antarctica) [1987, eng] E-37036
Palaeoxylology of Antarctica: *Sahnioxylon antarcticum* n. sp. [1988, fre] E-37499

Lookout, Cape
Thermobarometry at Scotia Metamorphic Complex, Cape Lookout [1986, spa] E-35262
K-Ar ages of the Scotia Metamorphic Complex, Cape Lookout [1986, spa] E-35263

Lützow-Holm Bay
Decomposition of organic matter under fast ice at Lützow-Holm Bay [1986, eng] B-35659
Krill overwintering strategy under fast ice in Lützow-Holm Bay [1986, eng] B-35660
Pinaciophora columna n. sp., *P. tasmanica* n. sp. and *P. apora* n. sp., new Heliozoeans from Australia, and a report of *P. fluviatilis* Greeff from Antarctica [1987, eng] B-37031
Downward flux of organic matter under fast ice [1987, eng] B-37453
Characteristics of ultramafic rocks in the Lützow-Holm Bay-Prince Olav Coast region [1986, eng] E-34775
Potassium pargasite from Einstödingen, Lützow-Holm Bay, East Antarctica [1985, eng] E-35457
Seismic profile off Riiser-Larsen Peninsula [1987, eng] E-36706
Mechanical properties of antarctic sea ice (II) [1987, eng] F-35100
Research on coastal ice-free area during 26th JARE [1987, eng] G-35745
Chlorophyll *a* in coastal waters [1987, eng] J-36575
Geophysical data of crustal structure of Mizuho Plateau [1986, eng] L-35037

Mac. Robertson Land
Bedrock topography of Enderby and Mac. Robertson lands [1987, rus] E-36934

Macquarie Island
Diet of the introduced rodents *Mus musculus* L. and *Rattus rattus* L. on subantarctic Macquarie Island [1986, eng] B-34819
Plant communities in Macquarie Island lakes [1986, eng] B-34895
Identification of Soft-plumaged petrel from Macquarie Island [1986, eng] B-35021
Seppeltia, a new leafy genus of Metzgeriales from Macquarie Island [1986, eng] B-35139
Studies on Macquarie Island lichens 3: the genus Sphaerophorus [1986, eng] B-35284
Lichens *Cladia* and *Cladonia* on Macquarie Island [1986, eng] B-35285
Gentoo penguin population and breeding at Macquarie Island [1986, eng] B-35289
Abundance of Royal penguins breeding at Macquarie Island [1987, eng] B-35446
Ducks of Macquarie Island [1987, eng] B-35922
New species of Ancorabolidae from Macquarie I. [1987, eng] B-36537
Status of elephant seal at Macquarie I. [1987, eng] B-36560
Revision of the *Coprosma pumila* (Rubiaceae) [1987, eng] B-36683
New Copepod from Macquarie I. [1987, eng] B-36888
Atlas of seeds and fruits from Macquarie Island [1986, eng] B-37153
Growth from birth to 20 days in elephant seal [1987, eng] B-37157
Fur seals *Arctocephalus* ssp. at Macquarie Island [1987, eng] B-37306
Contrasts in vegetation pattern: Heard Island and Macquarie Island [1987, eng] B-37362
Analysis of bryophyte distribution patterns on subantarctic Macquarie Island [1987, eng] B-37363
Seasonal breeding in male southern elephant seal at Macquarie I. [1985, eng] B-37412
Diet of the King Penguin *Aptenodytes patagonicus* at Macquarie Island [1988, eng] B-37419

Macquarie Island *(cont.)*
Status and conservation of seabirds at Macquarie Island [1984, eng] **B-37425**
Longevity, fertility and philopatry of female southern elephant seals [1988, eng] **B-37500**
Geology and geomorphology of Macquarie Island with special emphasis on heavy metal trace element distribution [1986, eng] **E-34708**
Hydrology and hydrochemistry of Macquarie I. natural waters [1984, rus] **E-35082**
Periglacial features of Macquarie I. and a tropical mountain [1986, ger] **E-36990**
Evidence from fossils for uplift during the Holocene in Green Gorge, Macquarie Island [1987, eng] **E-37354**
Cell-mediated immunity in healthy adults [1986, eng] **H-35016**
Atmospheric CO2 measurements in the Australian region [1987, eng] **I-35474**
Pulsating aurora and magnetic Pi(c) pulsations [1987, eng] **K-35957**
Ground-satellite studies of Pc1 pulsation propagation [1987, eng] **K-35959**
Periodic TIDs in both hemispheres following auroral disturbances [1987, eng] **K-35970**
Ionospheric irregularities around L=4 using satellite beacons [1987, eng] **K-35971**
AUSSAT beacon proposal—relevance to antarctic stations [1987, eng] **K-35977**
Ionosphere electron content north of Macquarie Island [1987, eng] **K-36765**

Marambio Station
Occlusion of polynucleate hydrocarbons in ice [1987, spa] **F-36515**

Marguerite Bay
Preliminary results from the *USCGC Glacier* 1985 cruise [1985, eng] **E-35335**

Marie Byrd Land
Alteration of antarctic hyaloclastites [1985, eng] **E-35173**
Reinterpretation of glaciovolcanic interactions in Marie Byrd Land [1985, eng] **E-35190**
Geochronology of Swanson Formation of Marie Byrd Land [1986, eng] **E-35288**
Granite geochronology in the Ford Ranges, Marie Byrd Land [1987, eng] **E-36971**
Comment on geochronological studies of the Swanson Formation of Marie Byrd Land [1987, eng] **E-36972**
Velocity of ice streams B and C, Antarctica [1987, eng] **F-36130**

Marion Island
Kelp gull predation on limpet *Nacella delesserti* [1985, eng] **B-34832**
Assimilation efficiency of White-chinned petrels fed different prey [1986, eng] **B-34912**
Foraging parameters of gentoo penguins at Marion Island [1987, eng] **B-34922**
Diet of the blue petrel at subantarctic Marion Island [1986, eng] **B-35026**
Energy expenditure of the albatross *Diomedea exulans* [1986, eng] **B-35292**
Morphology, energy and otoliths of the cod *Paranotothenia magellanica* [1986, eng] **B-35432**
Insects of Marion and Prince Edward Islands [1986, eng] **B-35496**
Control of Marion Island cat population [1986, eng] **B-35519**
Selective advantages of alien predators on Marion Island [1986, eng] **B-35520**
Case study of a midge introduced on Marion Island [1986, eng] **B-35521**
Production and nutrient dynamics of plant communities on a subantarctic island. 1. Standing crop and primary production of mire-grasslands [1987, eng] **B-35610**
Carbon flow in the pelagic zone of a lava-lakelet on Marion I. [1987, eng] **B-35614**
Standing crop and primary productivity of fjaeldmarks and fernbrakes on Marion I. [1987, eng] **B-35615**
Feather growth, mass loss and duration of moult in Macaroni and Rockhopper Penguins [1986, eng] **B-35641**
Squid beaks regurgitated by albatrosses on Prince Edward Is. [1986, eng] **B-35642**
Seasonal and annual diet variation in Macaroni and Rockhopper penguins at Marion I. [1987, eng] **B-35878**
Seasonal variation in the diet of King penguins at Marion I. [1987, eng] **B-35880**
Kelp degradation by fly larvae at Marion I. [1987, eng] **B-36121**
Effects of feline panleucopaenia on Marion I.'s cat population [1987, eng] **B-36153**
Bacterial activity in soils of a subantarctic island [1987, eng] **B-36329**
Vesicular-arbuscular mycorrhizas at a subantarctic island [1986, eng] **B-36552**
Energy requirements for growth and maintenance in macaroni and rockhopper penguins [1987, eng] **B-36617**
Production and nutrient dynamics of plant communities on a subantarctic island [1987, eng] **B-36619**
Production and nutrient dynamics of plant communities on a subantarctic island [1988, eng] **B-36820**
Environment and biota of Marion Island [1987, eng] **B-37016**
Production and nutrient dynamics of plant communities on a subantarctic island [1988, eng] **B-37123**
Skull morphometrics of male antarctic and subantarctic fur seals *Arctocephalus gazella* and *A. tropicalis,* and their interspecific hybrids [1987, eng] **B-37305**
Volcanic ash soils and climate of Marion Island [1921, eng] **E-35212**
Seasonal changes in plant and soil chemistry at Marion Island, Pt.1 [1987, eng] **E-37347**
Seasonal changes in plant and soil chemistry at Marion Island, Pt.2 [1987, eng] **E-37348**
Chemical composition of precipitation at Marion Island (sub-Antarctic) [1987, eng] **I-36102**

Mawson Station
Postlarva of *Cygnodraco mawsoni* Waite, 1916 [1987, eng] **B-37337**
Future of Mawson Institute in doubt [1986, eng] **G-34700**
Cell-mediated immunity in healthy adults [1986, eng] **H-35016**
Atmospheric CO2 measurements in the Australian region [1987, eng] **I-35474**
Stratospheric dynamics, energetics and chemistry study proposal [1987, eng] **I-35974**
Australian upper atmospheric and space research, 1987 [1987, eng] **K-35955**
Conjugate effects from ground excitation of ULF waves in the ionosphere [1987, eng] **K-35958**
Morphology of the midday radio aurora in the Southern Hemisphere [1987, eng] **K-35960**
Middle atmosphere winds at Mawson. 1. Mean circulation and large scale motions [1987, eng] **K-35961**
Middle atmosphere winds at Mawson. 2. Tides [1987, eng] **K-35962**
Middle atmosphere winds at Mawson. 3. Geomagnetism and meteorology [1987, eng] **K-35963**
Thermosphere dynamics over Mawson. 1. Diurnal variation and geomagnetic dependence [1987, eng] **K-35964**
Thermosphere dynamics over Mawson. 2. Y component of magnetic field [1987, eng] **K-35965**
Thermosphere dynamics over Mawson. 3. Wind field horizontal divergence [1987, eng] **K-35966**
Thermosphere dynamics over Mawson. 4. Lower thermosphere [1987, eng] **K-35967**
Mesosphere winds and temperature at Mawson [1987, eng] **K-35968**
Upper atmosphere research recommendations [1987, eng] **K-35973**

McMurdo Ice Shelf
Diatoms of the McMurdo Ice Shelf [1987, eng] **B-36685**

McMurdo Sound
Scavenging and other feeding habits of lysianassid amphipods from McMurdo Sound [1986, eng] **B-34665**
Influence of sea ice and sea ice biota on light in McMurdo Sound [1984, eng] **B-34735**
Primary productivity of phytoplankton in McMurdo Sound [1986, eng] **B-34785**
Photoadaptation of a colonial microalgal bloom in McMurdo Sound [1986, eng] **B-34788**
Cell division rates in algae of McMurdo Sound [1986, eng] **B-34790**
Pleuragramma antarcticum as food for other fishes [1985, eng] **B-34830**
Shallow-water foraminiferal ecology, Pacific Ocean [1980, eng] **B-34847**
Echinoid and asteroid eggs and juveniles [1986, eng] **B-34913**
Fatty acid composition and microbial activity in McMurdo Sound sediments [1986, eng] **B-35122**
Photosynthesis and carbon metabolism of phytoplankton from McMurdo Sound, Pt1 [1987, eng] **B-35124**
Ecology of sea ice microbial communities of McMurdo Sound [1985, eng] **B-35359**
Lipid composition and microbial activity of selected recent antarctic benthic marine sediments and organisms: a mechanism for monitoring and comparing microbial populations [1985, eng] **B-35360**
Photoadaptive strategies in a natural population of *Phaeocystis pouchetii* in McMurdo Sound [1985, eng] **B-35361**

Contrasting modes of reproduction by common shallow-water antarctic invertebrates [1985, eng] B-35364
Photoadaptations of photosynthesis and carbon metabolism by antarctic phytoplankton: species-specific and community responses [1985, eng] B-35368
Trophic position of benthic rhizopods in McMurdo Sound [1985, eng] B-35369
Freezing avoidance and the distribution of antifreeze glycopeptides in antarctic fish [1985, eng] B-35376
Examination of potential hearing damage in Weddell seals *(Leptonychotes weddelli)* in McMurdo Sound, Antarctica [1985, eng] B-35385
Metabolites of the antarctic sponge *Dendrilla membranosa* [1987, eng] B-35408
Sea ice microbial communities. 6. Growth and primary production in bottom ice under graded snow cover [1987, eng] B-35443
Sea ice microbial communities. 7. Changes in under-ice spectral irradiance during the developments of antarctic sea ice microalgal communities [1987, eng] B-35444
Bacterial production in annual sea ice in McMurdo Sound [1987, eng] B-35445
Environmental and photosynthetic relationships in antarctic sea ice algae [1987, eng] B-35456
Hypercapnia and hypoxia in Weddell seals ventilatory responses [1987, eng] B-35463
Relationship between invertebrate predation and benthic sponges [1987, eng] B-35720
Benthic foraminifera in McMurdo Sound [1987, eng] B-35760
Weddell seal population dynamics in McMurdo Sound [1987, eng] B-35894
Biochemical composition of antarctic echinoderms [1987, eng] B-36298
Summer tide-crack phytoplankton in McMurdo Sound [1987, eng] B-36331
Development, metamorphosis and population of a sea urchin [1987, eng] B-36396
Heart rate and body temperature during free diving of Weddell seals [1987, eng] B-36426
Incorporation of amino acids and glucose in microalgae [1987, eng] B-36457
Antifreeze glycopeptides in fish [1987, eng] B-36512
Biological production at the ice-water ergocline [1986, eng] B-36563
Zooplankton under spring sea ice at McMurdo [1987, eng] B-36696
Planktivory in *Pagothenia borchgrevinki* in McMurdo Sound [1987, eng] B-36697
Midwater food web in McMurdo Sound [1987, eng] B-36865
Respiration of the antarctic fish from McMurdo Sound [1987, eng] B-36890
Light absorption and photosynthesis in antarctic microalgae [1987, eng] B-36915
Long-term reproductive patterns and sighting bias in Weddell seals *(Leptonychotes weddelli)* [1987, eng] B-36963
Sea ice microbial communities (SIMCO). 9. Effects of temperature and salinity on rates of metabolism and growth of autotrophs and heterotrophs [1988, eng] B-37127
Juvenile survival and recruitment in a population of Weddell seals in McMurdo Sound [1987, eng] B-37165
Schackoinella antarctica, a new species of Foraminiferida (Glabratellidae) [1987, eng] B-37195
Occurrence of an isoprenoid C25 diunsaturated alkene and high neutral lipid content in antarctic sea-ice diatom communities [1988, eng] B-37238
Comparison of photosynthesis diel patterns in polar and temperate phytoplankton [1988, eng] B-37377
Milk production and pup growth in Weddell seal at McMurdo Sound [1985, eng] B-37413
Antarctic Cenozoic history from the MSSTS-1 drillhole, McMurdo Sound [1986, eng] E-34800
Stratigraphy of the MSSTS-1 core [1986, eng] E-34801
Sediment texture of the MSSTS-1 core [1986, eng] E-34802
Floral fossils in the MSSTS-1 core [1986, eng] E-34803
Late Oligocene foraminifera in the MSSTS-1 core [1986, eng] E-34805
Late Cenozoic foraminifera in the MSSTS-1 core [1986, eng] E-34806
Palynology of the MSSTS-1 core [1986, eng] E-34807
Historical sand sources in the MSSTS-1 core [1986, eng] E-34808
Basaltic clasts from a portion of the MSSTS-1 core [1986, eng] E-34809
Clay minerals in the MSSTS-1 core [1986, eng] E-34810
Depth of burial and hydrocarbon source rock potential [1986, eng] E-34812
Seismic velocities in the MSSTS-1 core [1986, eng] E-34813
Correlation of seismic reflection data of the MSSTS-1 drillhole [1986, eng] E-34814
Dry valleys/McMurdo Sound magnetostratigraphy and sedimentology project: a progress report [1985, eng] E-35163
Physical properties of Cenozoic rock, McMurdo Sound region [1985, eng] E-35164
Deep seismic soundings along the boundary between East and West Antarctica. [1985, eng] E-35166
Petrology and geochemistry of inclusions of lower crustal basic granulites from the Erebus Volcanic Province, Antarctica [1985, eng] E-35167
Cainozoic glacial marine sedimentation in McMurdo Sound drill hole [1986, eng] E-35258
Glaciation and sea level change western McMurdo Sound [1987, eng] E-35929
Oligocene sequence cored at CIROS-1, western McMurdo Sound [1987, eng] E-36267
Japanese earth science research at McMurdo in 1986-1987 [1987, eng] E-36579
Glass and amphibole in spinel-wehrlite xenoliths from Foster Crater [1987, eng] E-36951
In situ measurements of the resistivity of antarctic sea ice [1986, eng] F-34737
Sea ice operation: McMurdo Sound-Granite Harbour [1986, eng] F-35296
Scattering and absorption of visible light by sea ice [1987, eng] F-35682
Moving loads on sea ice [1987, eng] F-35773
Chemical fractionation of brine in McMurdo Ice Shelf [1986, eng] F-36029
Thermally driven changes in the optical properties of sea ice [1987, eng] F-36266
Light transmission in sea ice [1987, eng] F-36269
Light scattering and absorption in sea ice, McMurdo Sound [1986, eng] F-36589
Icebreaking operations in McMurdo Sound, Antarctica [1986, eng] G-34999
Operation of light air cushion vehicle at McMurdo Sound [1987, eng] G-35052
Coprostanols in marine sediments as biomarker for marine mammal pollution [1986, eng] J-35112
Suspended particulate matter in antarctic coastal waters [1985, eng] J-35344
Vertical sediment flux beneath annual sea ice, McMurdo Sound, Antarctica [1985, eng] J-35349
Currents, water quality, sediments, and bathymetry, McMurdo Sound [1986, eng] J-36835
Diploptene in antarctic sediments [1988, eng] J-37008
Paleomagnetic stratigraphy [1986, eng] L-34804
International gravimetric connections along the Circum-Pacific zone. 4. Drift characteristics of LaCoste & Romberg gravimeters (Model G) [1983, jpn] L-35643
Lateral isotopic discontinuity in the lower crust [1987, eng] L-36159

McMurdo Station

Microcomputer monitor and blood sampler for free-diving Weddell seals [1986, eng] B-34816
Airborne observations of terrestrial surfaces [1986, eng] C-35850
Development of methodology for design of snow roads and airstrips [1986, eng] F-36873
Your stay at McMurdo Station, Antarctica [1985, eng] G-34722
Navy support to USARP, 1984-1985 [1985, eng] G-35573
Wind hybrid power system for antarctic Inmarsat link [1986, eng] G-35636
Stratospheric ozone and aerosol measurements in spring 1985 [1986, eng] I-34968
Causes and effects of a hole [1987, eng] I-35126
Balloon-borne observations of the development and vertical structure of the antarctic ozone hole in 1986 [1987, eng] I-35243
Nature and size of microscopic airborne particles at McMurdo Station [1985, eng] I-35535
High-altitude aerosol variations associated with stratospheric warmings [1985, eng] I-35544
Depletion of ozone layer above Antarctica [1986, eng] I-35877
Variations in NO2 and O3 at McMurdo [1987, eng] I-36160
Observations of OClO at McMurdo Station [1987, eng] I-36161
Observations of NO3 at McMurdo Station [1987, eng] I-36162

McMurdo Station *(cont.)*
Diurnal variations of ClO in the springtime stratosphere over McMurdo [1987, eng] **I-36321**
Secular variation of ClO in the springtime stratosphere over McMurdo [1987, eng] **I-36322**
Decay of El Chichón stratospheric aerosol cloud in Antarctica [1987, eng] **I-36608**
Ozone over McMurdo Station, austral spring 1986 [1987, eng] **I-36611**
Meteorological data from automatic weather stations near McMurdo [1983, eng] **I-36656**
Statistical approach to visibility forecasting at McMurdo [1986, eng] **I-36676**
Stratospheric trace gases in the spring 1986 antarctic atmosphere [1987, eng] **I-36779**
Aerosol and ozone measurements in the antarctic stratosphere [1988, eng] **I-37058**
Aerosols related to polar stratospheric cloud theories [1988, eng] **I-37059**
N2O in the springtime stratosphere over McMurdo [1988, eng] **I-37216**
New insights into cosmic-ray propagation in the heliosphere [1985, eng] **K-35558**
Measurement of ionospheric electron columnar content changes over McMurdo Station [1985, eng] **K-35559**
Cosmic ray intensity pulses [1979, eng] **K-36922**
Enhanced isotropic cosmic ray intensity waves during cosmic ray storms [1979, eng] **K-36923**

Melbourne, Mount
Biota and environment of the fumaroles on Mt. Melbourne [1987, eng] **B-35613**
Volcanism at Shield Nunatak, Mount Melbourne [1987, eng] **E-37317**

Mertz Bank
Glacial and iceberg effects on morphology off Wilkes Land [1987, eng] **E-36094**

Mesa Range
Mineral chemistry of the Kirkpatrick Basalt, northern Victoria Land [1985, eng] **E-35171**
Exposure Hill Formation, Mesa Range [1986, eng] **E-35913**
Potassium-Argon age determinations of the Kirkpatrick Basalt, Mesa Range [1986, eng] **E-35914**
Paleomagnetism and hydrothermal alteration: Kirkpatrick Basalt Group, Victoria Land [1985, eng] **L-35172**
Paleomagnetism in the Kirkpatrick Basalt Group [1986, eng] **L-35915**

Meserve Glacier
Magnetic model studies of volcanic cones in the ice-free valleys of southern Victoria Land [1985, eng] **E-35162**

Millen Range
Structural geology of the Robertson Bay and Millen terranes, northern Victoria Land, Antarctica [1986, eng] **E-35906**
Chronology of volcanics and rocks, Victoria Land [1986, eng] **E-35909**

Mirnyy Station
Preliminary results of microbiological investigations at Mirnyy [1986, rus] **B-34720**
Use of sea ice for cargo unloading [1986, rus] **F-34718**
Study of long period average accumulation of atmospheric precipitation in the Mirnyy Station area [1987, rus] **F-37069**
Unloading of a large tanker near Mirnyy Station [1986, rus] **G-34717**
Homogeneity of series of mean monthly wind speed data for Soviet antarctic stations [1981, rus] **I-34933**
Surface wind velocity profiles in Antarctica [1981, rus] **I-34934**
Background of atmospheric transparency regime [1986, eng] **I-35817**
Inspection of Mirnyy Station [1986, rus] **I-36234**
Experimental data on aerosol optical thickness in Antarctica in summer 1984/85 [1987, eng] **I-36863**
Anomalous decrease of atmospheric transparency over Antarctica [1987, rus] **I-37071**
Radio auroral observations at the daytime cusp [1983, eng] **K-35301**
Diagnostics of the dayside cusp with a northern direction of interplanetary field [1983, eng] **K-35303**
Magnetic disturbances from interplanetary magnetic field in in polar cap in summer [1984, eng] **K-35304**
North-south asymmetry of galactic cosmic rays [1986, eng] **K-35433**
Enigmas of the zonal modulation of cosmic rays [1986, eng] **K-36261**
Annual cosmic-ray variations in the lower atmosphere [1986, eng] **K-36262**
Time-dependence of the short-range component of cosmic rays in the stratosphere [1986, eng] **K-36263**

Mizuho Plateau
Satellite Doppler stations in the Showa region [1986, eng] **C-34739**
Antarctic ice sheet configuration 30 deg E to 80 deg E [1986, eng] **C-34769**
Crustal structure in the Mizuho Plateau [1986, eng] **L-35036**
Geophysical data of crustal structure of Mizuho Plateau [1986, eng] **L-35037**

Mizuho Station
Pb-210 measurement of snow accumulation at Mizuho Station [1986, eng] **F-34781**
Glacio-geophysical implications of NNSS positioning at Showa Station [1986, eng] **F-35040**
Ice crystal growth form and mechanism at low atmospheric saturation [1986, eng] **F-35690**
Borehole closure at Mizuho Station [1986, eng] **F-35694**
Textures and fabrics of 700-m deep ice core from Mizuho Station [1986, eng] **F-35695**
Volume expansion of a 413.5-m Mizuho core after its recovery [1986, eng] **F-35696**
JARE-26 glaciological research, 1984-1986 [1987, eng] **F-35704**
Ice crystals in subsaturated air [1987, eng] **F-36603**
Orientation and strain of 700-m Mizuho ice core [1987, eng] **F-36604**
New types of spherules from Antarctica: meteoritic impact origin? [1987, eng] **F-37097**
Initiation condition of drifting snow [1987, jpn] **F-37488**
Daily physical activity estimated from heart rate during wintering in Antarctica [1984, jpn] **H-35649**
Meteorological data at Mizuho Station, 1985 [1986, eng] **I-34740**
Low-level katabatic wind structure at Mizuho Station [1986, eng] **I-35098**
Clouds and high pressure at Showa and Mizuho Stations [1987, eng] **I-36190**
Spectral characteristics of Pc 3 and Pc 4/5 magnetic pulsation bands observed near L=6 [1984, eng] **K-36905**

Molodezhnaya Station
Third antarctic expedition of Polish biologists, 1973-1974 [1974, pol] **A-35053**
Homogeneity of series of mean monthly wind speed data for Soviet antarctic stations [1981, rus] **I-34933**
Long wave radiation in the atmosphere at Molodezhnaya [1986, eng] **I-35819**
Stratospheric and mesospheric wind and temperature over Molodezhnaya [1986, eng] **I-35840**
Strong winds in the Molodezhnaya Station area in 1979 [1986, rus] **I-36196**
Characteristics of a semiautomatic method for actinometric measurements [1986, rus] **I-36430**
Experimental data on aerosol optical thickness in Antarctica in summer 1984/85 [1987, eng] **I-36863**
Winter variation statistics of antarctic upper air meteorological parameters [1987, rus] **I-36927**
Temperature variability in the middle atmosphere over the Antarctic [1987, rus] **I-36931**
Stratospheric and mesospheric processes over the Southern Hemisphere in winter 1985 [1987, eng] **I-37143**
Comparison of experimental and computed long-range oblique-sounding ionograms on the Moscow-Molodezhnaya (Antarctica) path [1985, eng] **K-35136**
Frequency limits and modal structure of signals on the Moscow-Molodezhnaya route [1985, rus] **K-35637**
Radio wave propagation over the Moscow-Antarctica path [1986, rus] **K-36198**
Admissible time deviations of radio signals, Moscow to Molodezhnaya [1986, rus] **K-36199**

Morozumi Range
Feldspar in till from the Morozumi Range [1986, eng] **E-35918**

Mühlig-Hofmann Mountains
Botany of the Mühlig-Hofmann and Gjelsvik Mountains, Part I [1986, eng] **B-35492**

Murphy, Mount
Reinterpretation of glaciovolcanic interactions in Marie Byrd Land [1985, eng] **E-35190**
Weather and solar radiation measurements at Mount Takahe and Mount Murphy, West Antarctica [1985, eng] **I-35531**

Napier Mountains
Antarctic ice sheet configuration 30 deg E to 80 deg E [1986, eng] **C-34769**

Nelson Island
Weddell seal preys on Chinstrap penguin [1988, eng] **B-37139**

Topographic survey of the South Shetland Islands [1987, spa] C-35889
New Schwabenland
Structural evolution and magmatism in western New Schwabenland [1987, eng] E-35800
Stake remeasurements on a blue ice field, Borg Massif [1987, ger] F-36187
Nimrod Glacier
Possible Proterozoic glaciation from Nimrod Glacier area [1988, eng] E-37246
Novolazarevskaya Station
Ozone distribution above Novolazarevskaya, 1985 [1987, eng] I-35329
Ozone observation at Novolazarevskaya GDR Research Base, May-Dec. 1985 [1987, eng] I-36645
Nye Mountains
Antarctic ice sheet configuration 30 deg E to 80 deg E [1986, eng] C-34769
Oates coast
Winter climatic conditions in the Somov Sea [1986, eng] I-35826
O'Higgins Station
Dec. 1983-Nov. 1984 seismological data from Bernardo O'Higgins Station [1986, spa] L-35270
Ohio Range
Lithofacies and origin of the Buckeye Formation, Ohio Range [1988, eng] E-37209
Petrology and sedimentology of the Horlick Formation, Ohio Range [1987, eng] E-37253
Oku-iwa Rock
Explanatory text and geological map of Honnör Oku-iwa Rock, Antarctica [1987, eng] E-36028
Olympus Range
Origin of Olympus granite-gneiss [1987, eng] E-36859
Onyx River
On the flooding of Vanda Station [1987, eng] E-36270
Orville Coast
Geology of portions of the Lassiter and Orville Coasts [1987, ger] E-36776
Oscar II Coast
Geology of southern Oscar II Coast [1987, eng] E-35768
Palmer Archipelago
Petrography of the Mesozoic intrusive suite of the Palmer Peninsula [1987, eng] E-37318
Palmer Land
Geochemistry of the Lassiter Coast Intrusive Suite [1986, eng] E-34870
Geology of the Black Coast, eastern Palmer Land [1987, eng] E-36844
Geology of parts of the west coast of Palmer Land [1987, eng] E-37333
Palmer Station
South Polar and Brown skuas' activity near Palmer Station [1986, eng] B-34817
Krill egg development in relation to pressure [1985, eng] B-34827
Filaroid nematode (Lemdaninae) from *Larus dominicanus* [1986, eng] B-35134
Ciliates and nanophytoplankton in Arthur Harbor, December 1984 and January 1985 [1985, eng] B-35362
Cold-stable microtubules from antarctic fish [1985, eng] B-35374
Nearshore foodwebs and the distribution of acanthocephalan parasites in antarctic seabirds [1985, eng] B-35377
Ornithological investigations at Palmer Station: the first long-distance tracking of seabirds by satellites [1985, eng] B-35378
Revised penguin numbers and distribution, Anvers Island [1987, eng] B-36211
Feeding and nesting ecology of sympatric South Polar and Brown skuas [1987, eng] B-36805
Movements of southern Giant Petrels ringed near U.S. Palmer Station, Antarctica [1987, eng] B-37248
Investigators guide to Palmer Station [1985, eng] G-34721
Palmer: an Antarctic Peninsula research station [1981, eng] G-37507
Atmospheric trace gas trends at Palmer Station, 1982-1985 [1986, eng] I-34973
Air chemistry monitoring at Palmer Station [1985, eng] I-35530
Electron precipitation events observed at Palmer Station [1987, eng] K-35282
Distributions of electron precipitation events observed at Siple and Palmer Stations [1987, eng] K-35283
Model predictions of subionospheric VLF signal perturbations [1986, eng] K-35406
Electron precipitation at VLF/LF phase perturbations [1985, eng] K-35554
Paulet Island
1903 Swedish expedition hut on Paulet Island, Antarctica [1988, eng] A-37296
Census of the Adélie penguin colony on Paulet Island, Weddell Sea [1985, eng] B-35383
Pensacola Mountains
New data on Upper Cambrian fauna of Ellsworth and Pensacola Mountains [1984, rus] E-35076
Peter I Island
Lee vortices in the Antarctic [1986, eng] I-35486
Pine Island Bay
Amundsen Sea sediment coring [1985, eng] E-35203
Pine Island Glacier
Glacial erosion in western Antarctica [1986, rus] F-34842
Plateau Station
Freezing rate determination by the isotopic composition of the ice [1987, eng] F-36607
Pleiades, The
Mineral chemistry of Late Cenozoic McMurdo Volcanic Group rocks from The Pleiades, northern Victoria Land [1986, eng] E-35916
Possession Island
Cold tolerance in subantarctic adult dipteran *Anatalanta aptera* [1987, fre] B-37361
Organization of earthworm communities on Possession Island, Crozet Islands [1987, fre] B-37367
Gravity stresses on Possession I. [1987, fre] E-37352
Pedogenic processes of fell-field soils of Possession I. [1987, fre] E-37353
Potter Cove
Biomass and spatial distribution of zooplankton in Potter Cove [1987, eng] B-37404
Pratts Peak
Kyanite and orthoclase occurrences in the Shackleton Range [1985, eng] E-35391
Prince Charles Mountains
Geological investigations in Lambert Glacier area [1987, rus] E-37063
Late Archean-Early Proterozoic metamorphic belts of the Shackleton Range and the Prince Charles Mountains (Antarctica) [1987, eng] E-37288
Westward moving disturbances in the Mawson-Davis area [1987, eng] I-37234
Prince Edward Island
Foraging parameters of gentoo penguins at Marion Island [1987, eng] B-34922
Insects of Marion and Prince Edward Islands [1986, eng] B-35496
Prince Edward Islands
Alien species at Prince Edward Islands [1986, eng] B-35517
Squid beaks regurgitated by albatrosses on Prince Edward Is. [1986, eng] B-35642
Arctocephalus tropicalis on the Prince Edward Islands [1987, eng] B-37301
Bird populations at PEI and Gough Island, 1951-1986 [1987, eng] B-37349
Distribution, populations, and foraging behavior of terns at PEI [1987, eng] B-37350
Prince Harald Coast
Moss communities in ice-free areas along Prince Harald Coast [1986, eng] B-35676
Prince Olav Coast
Flora and vegetation of mosses in ice-free areas of Soya Coast and Prince Olav Coast, East Antarctica [1981, eng] B-35647
Characteristics of ultramafic rocks in the Lützow-Holm Bay-Prince Olav Coast region [1986, eng] E-34775
Progressive metamorphism of calc-silicate rocks, East Antarctica [1987, eng] E-36709
Princess Astrid Coast
Studies on antarctic phytoplankton [1986, eng] B-36746
Coral collected off Princess Astrid Coast [1986, eng] B-36749
Astrid Ridge fracture zone, Queen Maud Land [1987, eng] E-35245
Oceanography from antarctic waters to India via Indian Ocean [1986, eng] J-36744
Passive continental margin of the Princess Astrid Coast [1986, eng] L-35041

Princess Ragnhild Coast
Four n.sp. of cumacean crustaceans [1987, eng] **B-37462**
Provender, Mount
Carbon-14 investigations on petrel breeding places [1987, ger] **B-36767**
Kyanite and orthoclase occurrences in the Shackleton Range [1985, eng] **E-35391**
Prydz Bay
Species identification of the silverfish *Pleuragramma antarctica* from Prydz Bay [1986, eng] **B-35410**
Zooplankton distribution in Prydz Bay, 1983-1984 [1986, eng] **B-35661**
Sexual differentiation in antarctic krill [1987, eng] **B-36309**
New bacterium isolated from marine environments [1987, eng] **B-36399**
Parmales, a new order of marine chrysophytes [1987, eng] **B-36452**
ADBEX III cruise: krill/zooplankton sampling data, Sep.-Dec. 1985 [1987, eng] **B-36766**
Distribution, abundance and population of krill in Prydz Bay [1988, eng] **B-36821**
Phytoplankton pigment data, Prydz Bay, 1985 [1987, eng] **B-37291**
Early glaciation of Antarctica [1988, eng] **E-37502**
Physical and chemical properties of the Indian Ocean water masses south of the polar front [1987, fre] **J-35222**
Nutrient depression in the blooming area of Prydz Bay [1986, eng] **J-35658**
FIBEX cruise to the Prydz Bay region, 1981: nutrient data [1987, eng] **J-35923**
ADBEX I cruise to the Prydz Bay region, 1982; nutrient data [1987, eng] **J-35924**
SIBEX II cruise to the Prydz Bay region, 1985: nutrient data [1987, eng] **J-35925**
ADBEX III cruise west of the Prydz Bay region, 1985: nutrient data [1987, eng] **J-35926**
Prydz Bay oceanographic data, Jan.-Mar. 1981 [1987, eng] **J-36468**
Oceanographic data Prydz Bay Jan.-Mar. 1982 [1987, eng] **J-36470**
Oceanographic data Prydz Bay Nov.-Dec. 1982 [1987, eng] **J-36471**
Water currents in Prydz Bay, 1985 [1988, eng] **J-37280**
Queen Fabiola Mountains
Weathering effects compared for antarctic and non-antarctic chondrites [1987, eng] **E-35450**
Aeromagnetic surveys over the Yamato Mountains and meteorite ice field [1987, eng] **L-35742**
Queen Maud Land
Ecology of *Cryptopygus sverdrupi* from Queen Maud Land [1986, eng] **B-34666**
Lichens and lichen parasites from Queen Maud Land, 1949-52 [1986, eng] **B-35428**
Terrestrial arthropods from Dronning Maud Land [1986, eng] **B-35493**
Variable summer abundances of zooplankton off Queen Maud Land [1986, eng] **B-36745**
Taxonomy of antarctic sponges [1986, eng] **B-36747**
Spatial distribution of antarctic krill off Queen Maud Land [1986, eng] **B-36751**
Breeding ecology of *Thalassoica antarctica* in Queen Maud Land [1987, eng] **B-37463**
Rb-Sr ages of metamorphic rock, Queen Maud Land [1986, eng] **E-34779**
South Atlantic Ocean and adjacent antarctic continental margin [1986, eng] **E-34898**
Tectonics of Late Proterozoic paired metamorphic complexes in Queen Maud Land [1987, eng] **E-35801**
Geology and geochronology of the Annandagstoppane granite, Queen Maud Land [1987, eng] **E-37182**
Precambrian geology of western Queen Maud Land [1987, eng] **E-37320**
Tectonic significance of dolerite dikes of Queen Maud Land [1987, eng] **E-37321**
Ground and satellite measurement of ice sheets, Queen Maud Land [1987, eng] **F-36071**
JARE reports bottom topography and ice cores, Queen Maud Land [1987, eng] **F-36079**
Glaciology and chemistry of snow in eastern Queen Maud Land [1987, eng] **F-37479**
Influence of atmospheric circulation on the formation of Weddell polynya [1986, rus] **I-35939**
Glaciological research program in east Queen Maud Land, East Antarctica, Part 6, Advance Camp, 1985 [1987, eng] **I-36573**
Queen Maud Mountains
Geology of the basement complex western Queen Maud Mountains [1986, eng] **E-37374**
Rauer Islands
Marine fauna in shallow coastal waters near the Rauer Islands [1987, eng] **B-36764**
Precambrian geological relationships in high-grade gneisses of the Rauer Islands [1987, eng] **E-36105**
Rennick Glacier
Jurassic tholeites in the region of the upper Rennick Glacier, north Victoria Land [1986, eng] **E-35912**
Late Cenozoic history of Rennick Glacier [1986, eng] **E-35917**
Riiser-Larsen Ice Shelf
Flow and thickness of Riiser-Larsenisen, Antarctica [1986, eng] **F-35870**
Riiser-Larsen's absolute movements, mass balance and snow temperature [1986, eng] **F-35871**
Riiser-Larsen oxygen isotopes and accumulation rates [1986, eng] **F-35872**
Riiser-Larsen Peninsula
Seismic profile off Riiser-Larsen Peninsula [1987, eng] **E-36706**
Robert Island
Significance of the Coppermine Peninsula in a terrestrial ecology research program [1988, spa] **B-37243**
Robertson Bay
Structural geology of the Robertson Bay and Millen terranes, northern Victoria Land, Antarctica [1986, eng] **E-35906**
Rodolfo Marsh Station
Installation of ionosonde at the ionospheric station Teniente Marsh [1986, spa] **K-35269**
Ionosonde measurements at Marsh, King George Island: first results [1987, eng] **K-36651**
Roi Beaudouin Station
Freezing rate determination by the isotopic composition of the ice [1987, eng] **F-36607**
Ronne Ice Shelf
Expedition ANTARKTIS-IV of RV *Polarstern* 1985/86. Report of Legs ANT-IV/3-4 [1987, ger] **D-37493**
Quantitative estimates of the mass flux and ice movement along the ice edges in the eastern and southern Weddell Sea [1987, eng] **F-35502**
Some aspects of the flow of the Ronne Ice Shelf [1987, eng] **F-35503**
Thickness of the Ronne Ice Shelf [1987, eng] **F-35683**
Glaciological studies of Rutford Ice Stream [1987, eng] **F-36350**
Meteorological conditions at Druzhnaya Base in summer 1980 [1986, rus] **I-36197**
Tidal spectrum underneath antarctic ice shelves [1986, eng] **J-34896**
Ross Ice Shelf
Phospholipids and carotenoids in cyanobacteria from different locations [1987, eng] **B-35320**
Remote sensing in the Ross Ice Shelf region [1987, eng] **C-36068**
Saturated porous layer beneath active ice stream [1986, eng] **F-34864**
Nitrate flux on the Ross Ice Shelf and its relation to solar cosmic rays [1986, eng] **F-34971**
Nitrate variability in South Pole and Ross Ice Shelf snow and firn [1985, eng] **F-35196**
Oceanic inclusions in the J-9 sea-ice core [1985, eng] **F-35351**
Controls of the Ross Ice Shelf flow and mass balance [1983, eng] **F-35420**
Nitrate deposition in Antarctica; temporal and spatial variations [1986, eng] **F-35469**
Ice-shelf backpressure: form drag versus dynamic drag [1987, eng] **F-35506**
Ice stream-ice shelf interaction in West Antarctica [1987, eng] **F-35507**
Glaciogeophysical survey of the interior Ross Embayment [1987, eng] **F-35508**
Finite-element method applied to a time-dependent flowband model [1987, eng] **F-35510**
Heat budget of the Ross drainage basin [1987, eng] **F-35513**
Modelling of basal water flux under Ross Ice Shelf [1987, eng] **F-35514**
Modelling the response of the West Antarctic Ice Sheet to a climatic warming [1987, eng] **F-35515**
Recent advance of the Ross Ice Shelf, Antarctica [1986, eng] **F-36032**
Texture of polar firn for remote sensing [1987, eng] **F-36067**
Constraints on models in the Ross Embayment, Antarctica [1987, eng] **F-36290**
Antarctic ice streams: a review [1987, eng] **F-36340**

Heat- and mass-exchange at the lower surface of the Ross Ice Shelf [1987, rus] F-36626
Position of the lower surface of the Ross Ice Shelf, Antarctica [1988, eng] F-37271
Discussion on the Ross Ice Cover in the Würm stage [1988, eng] F-37273
Digital radar system for echo studies on ice sheets [1987, eng] G-36078
Real-time measurements of droplet size distribution in antarctic coastal clouds [1985, eng] I-35533
Weather and climate near Ross Island [1986, eng] I-36666
Tidal spectrum underneath antarctic ice shelves [1986, eng] J-34896
Microearthquakes of the eastern Ross Ice Shelf [1987, eng] L-36069

Ross Island
Study of heterotrophic microorganisms collected in Victoria Valley and Ross Island nearshore, Antarctica [1986, chi] B-35884
Protection of terrestrial plants and animals in the Ross Sea region [1987, eng] B-36858
Seismicity in the vicinity of Ross Island [1986, eng] E-35042
Fluid inclusions in olivine in a basanite flow from Ross Island, Antarctica [1985, eng] E-35168
Eruption of Mount Erebus and Ross Island seismicity, 1984-1985 [1985, eng] E-35169
Alteration of antarctic hyaloclastites [1985, eng] E-35173
On physical properties of aerosol at Ross Island, Antarctica [1986, eng] I-35114
Dynamics and kinematics of the surface layer over Ross Ice Shelf [1987, eng] I-36982

Ross Sea
South Polar Skua colonies in Ross Sea region [1986, eng] B-34729
Mesoscale cycling of nitrogen and silicon in Ross Sea phytoplankton blooms [1986, eng] B-34786
Marine ecology of Ross Sea birds [1984, eng] B-35215
Status and conservation of birds, Ross Sea region [1984, eng] B-37426
Express analysis of satellite radar images of sea ice [1987, eng] C-36486
Uplift and subsidence in the Transantarctic Mountains [1986, eng] E-34860
South Atlantic Ocean and adjacent antarctic continental margin [1986, eng] E-34898
Recycled palynomorphs in Ross Sea sediments [1984, eng] E-35095
Basal sediment ages of 1983 piston cores [1985, eng] E-35355
Geology and geophysics of the western Ross Sea [1987, eng] E-36164
Geology and structure of the Ross Sea region [1987, eng] E-36165
Seismic reflection data, western Ross Sea [1987, eng] E-36166
Stratigraphy and structure, Victoria Land basin, Ross Sea [1987, eng] E-36167
Western Ross Sea unconformity [1987, eng] E-36168
Structure of the rifted crust beneath the western Ross Sea [1987, eng] E-36169
Geology and physical properties of the Ross Sea [1987, eng] E-36174
Hydrocarbon geochemistry of sediments offshore from Antarctica [1987, eng] E-36175
Diatoms from the 1984 USGS antarctic cruise in the Ross Sea [1987, eng] E-36176
Rock samples from Iselin Bank, Ross Sea [1987, eng] E-36177
Till and glacial-marine sand grain from the Weddell and Ross seas [1987, eng] E-36394
Multiple sources of alkanes in Quaternary oceanic sediments of Antarctica [1987, eng] E-36398
Main features of the tectonic structure of the Ross Sea megabasin [1987, rus] E-36936
Victoria Lower Glacier and Ross Sea glaciation, Dry Valleys [1987, eng] F-36906
Airborne measurements of the antarctic cloud water acidity [1985, eng] I-35534
Winter climatic conditions in the Somov Sea [1986, eng] I-35826
Hydrochemical conditions of the Ross Sea [1986, rus] J-35217
Suspended and deposited sediments in Bransfield Strait [1985, eng] J-35343
Suspended particulate matter in antarctic coastal waters [1985, eng] J-35344
Ross Sea oceanography, 1985 [1985, eng] J-35350
Gravity studies of the Victoria Land basin and Iselin Bank [1987, eng] L-36170
Antarctic continental margin magnetic gradiometer data [1987, eng] L-36171
Interpreting magnetic gradiometer and MSR observations, Ross Sea [1987, eng] L-36172
Heat flow and tectonics in the western Ross Sea, Antarctica [1987, eng] L-36173

Rothera Station
Proteinuria in polar travellers [1987, eng] H-35775

Royal Society Range
Petrology and geochemistry of inclusions of lower crustal basic granulites from the Erebus Volcanic Province, Antarctica [1985, eng] E-35167

Rundvågs Head
Gravity surveys by JARE-27 near Showa Station and Asuka Camp [1986, jpn] L-35207

Rutford Ice Stream
Glaciological studies of Rutford Ice Stream [1987, eng] F-36350

Saint Paul Island
Maritime fur trade: sealers and other residents on St. Paul and Amsterdam islands. Pts. 1 and 2 [1984, eng] A-37489

SANAE Station
Magnetospheric substorm observed at SANAE Station, 1979 [1987, eng] K-35129
Correlated pulsations in auroral light intensity and narrow band VLF emissions [1986, eng] K-36687
Riometer absorption and spectral index for precipitating electrons with exponential spectra [1987, eng] K-36965
South African experience in antarctic atmospheric physics research [1987, eng] K-37197

Schirmacher Hills
Temperature effect on bacteria in the Schirmacher Hills [1986, eng] B-36750
Geocryology of the Schirmacher Hills [1986, eng] E-35479
Geology of the Schirmacher Hills [1986, eng] E-36754
Geology of Schirmacher Hills [1986, eng] E-36755
Sediments of the Schirmacher Hills and nearby sea bed [1986, eng] E-36756
Geochemistry and mineralogy of rocks of the Schirmacher Hills [1986, eng] E-36757
Magnetic characteristics in Antarctica over geological contacts in Schirmacher Hill region and the ice shelf near Dakshin Gangotri (70 deg 05' 37"S, 12 deg 00' 00"E) [1986, eng] L-36758

Schirmacher Ponds
Algological study in Schirmacher and Unter-See lakes [1987, ger] B-36454
Preliminary report of the Third Indian Antarctic Expedition [1985, eng] E-35390
Lacustrine ice in the Schirmacher and Unter-See ponds in Antarctica [1987, rus] F-36627
Ice sheet composition and structure in the Schirmacher Ponds area [1987, rus] F-36941

Scotia Sea
Biomass, distribution, and trophodynamics of *Salpa thompsoni* in the Scotia Sea near the Antarctic Peninsula, austral summer 1983-1984 [1985, eng] B-35370
Lipid content and composition of some midwater crustaceans from the southern ocean [1986, eng] B-35622
Density nutrients and phytoplankton in the ice edge zone of the Weddell-Scotia Sea [1987, eng] B-36009
Oceanographic structure of Scotia Sea and copepod distribution in 1981 [1987, eng] B-36115
Species composition and distribution of antarctic ichthyoplankton [1987, rus] B-36280
Biomass and phytoplankton composition in Scotia Sea and South Shetland Islands [1987, spa] B-36361
Discards from commercial fishing of krill found during the *Antártida 8611* cruise [1987, spa] B-36379
New species of parasite in finned octopod [1983, eng] B-36542
Some results on quantitative investigations of macrozoobenthos in the Scotia Arc (Antarctica) [1988, eng] B-37121
Drake Passage/Western Scotia Sea [1986, eng] B-37252
Factors regulating the distribution patterns of seabirds [1987, eng] B-37398
In Scotia Sea [1987, rus] D-36475
Continental magnetic anomalies and the evolution of the Scotia Arc [1987, eng] E-35068
Mechanism of spreading in marginal seas [1986, eng] E-35459
Geodynamics of the South Antilles region [1986, eng] E-36178
Geochemical characteristics of back-arc basin basalt [1985, eng] E-36416
Weddell-Scotia sea ice margin, Oct. 1984 [1986, eng] F-34750

Scotia Sea *(cont.)*
Thermobaric and ice conditions, South Orkney region [1986, eng] **I-35824**
Water masses and currents off the Antarctic Peninsula [1986, eng] **J-34690**
Physical and chemical data for the South Atlantic Ocean [1985, eng] **J-35065**
Atlantic long lines, leg II, Cape Town to Punta Arenas [1985, eng] **J-35354**
Preliminary observations on the distribution of micronutrients during the *Antártida 8611* cruise (Nov. 1986-Feb. 1987) [1987, spa] **J-36357**
Chlorophyll *a* distribution in the Atlantic sector of the Antarctic in the austral summer 1986-1987, *Antártida 8611* [1987, spa] **J-36358**
Antarctic Summer Campaign 1979-1980 [1987, spa] **J-36730**
Westward bottom currents along the margin of the South Shetland Arc [1988, eng] **J-37381**

Scott Station
Recovery from exhausting exercise in an antarctic fish, *Pagothenia borchgrevinki* [1988, eng] **B-36817**
JARE geochemical studies in the Dry Valleys region 1984-1985 [1987, jpn] **E-37484**
Southern Hemisphere nitrogen dioxide [1985, eng] **I-34943**
Atmospheric mercury concentrations inside Scott Base [1987, eng] **I-36856**

Scullin Monolith
Birds of Scullin Monolith [1987, spa] **B-36387**

Seymour Island
Albian Megatrigoniinae and cretaceous bivalvia [1987, spa] **B-37133**
1985 Seymour Island expedition [1985, eng] **E-35178**
Searching for evidence of an impact event at the Cretaceous/Tertiary boundary on Seymour Island [1985, eng] **E-35179**
Unusual occurrence of Upper Eocene nautilids on Seymour Island [1985, eng] **E-35180**
Palynology progress, James Ross Island basin [1985, eng] **E-35181**
Location of the Cretaceous/Tertiary contact on Seymour Island [1985, eng] **E-35183**
Late Cretaceous stratigraphy, sedimentology and macropaleontology of Seymour Island [1984, eng] **E-35421**
Upper Eocene La Meseta Formation, Seymour I. [1987, eng] **E-36260**
Hoploparia stokesi from the Lopez de Bertodano Formation, Seymour I. [1987, eng] **E-36954**
Gigantic phororhacoid(?) bird from Antarctica [1987, eng] **E-36955**
Description and interpretation of a Cretaceous section of Seymour I. [1987, spa] **E-37132**
Antarctic marine temperatures: late Campanian through early Paleocene [1987, eng] **J-35751**

Shackleton Range
Kyanite and orthoclase occurrences in the Shackleton Range [1985, eng] **E-35391**
Gaseous hydrocarbons in metamorphic pararocks of Antarctica [1987, eng] **E-35470**
Late Archean-Early Proterozoic metamorphic belts of the Shackleton Range and the Prince Charles Mountains (Antarctica) [1987, eng] **E-37288**

Shield Nunatak
Volcanism at Shield Nunatak, Mount Melbourne [1987, eng] **E-37317**

Shirase Glacier
Airborne radio echo-sounding in Shirase Glacier basin [1987, eng] **F-36074**

Showa Station
Flora and vegetation of mosses in ice-free areas of Soya Coast and Prince Olav Coast, East Antarctica [1981, eng] **B-35647**
Microbiology of human pollution at Showa Station [1985, jpn] **B-35650**
Proceedings of the eighth Symposium on Polar Biology, 1985 [1986, eng] **B-35653**
Ice-algae photosynthesis under fast ice at Showa Station [1986, eng] **B-35657**
Sea ice meiofauna at Showa Station [1986, eng] **B-35664**
Biomass estimation of epifaunal megabenthos by stereophotography [1986, eng] **B-35667**
Snow algal bloom and habitat at Showa Station [1986, eng] **B-35671**
Soil nutrient and algal distribution near Showa Station [1986, eng] **B-35672**
Epiphytic algae on mosses near Showa Station [1986, eng] **B-35674**
Fruiting plants of *Bryum* near Showa Station [1986, eng] **B-35675**
Gemmae of mosses from Showa Station [1986, eng] **B-35677**
Terrestrial nematodes around Showa Station [1986, eng] **B-35680**
Marine biological studies during the 25th JARE [1987, eng] **B-35744**
Penguins, seals and seabirds near Showa Station in 1985 [1987, eng] **B-35746**
Tissue distribution of heavy metals in Weddell seals *(Leptonychotes weddellii)* [1987, eng] **B-36219**
Ice algae as food of an antarctic ice-associated copepod, *Paralabidocera antarctica* (I.C. Thompson) [1987, eng] **B-37460**
Epiphytic algae on a moss community at Showa Station [1987, eng] **B-37469**
Satellite Doppler stations in the Showa region [1986, eng] **C-34739**
Activities of the wintering party of the 26th JARE [1987, eng] **D-35743**
Trace element geochemistry of metabasites near Showa Station [1987, eng] **E-36710**
Glacio-geophysical implications of NNSS positioning at Showa Station [1986, eng] **F-35040**
Morphology of bullet-type snow crystals at Showa Station [1986, eng] **F-35691**
Trace elements in surface snow near Showa Station [1986, eng] **F-35692**
Initiation condition of drifting snow [1987, jpn] **F-37488**
Attitude detection by horizon aspect sensor on rockets [1987, eng] **G-36057**
New multimode FM/CW ionosonde [1987, eng] **G-36064**
Daily physical activity estimated from heart rate during wintering in Antarctica [1984, jpn] **H-35649**
Balloon observation of aerosols in the antarctic troposphere and stratosphere [1986, eng] **I-34855**
Ozone measurements at Showa Station Feb. 1982-Jan. 1983 [1985, eng] **I-34944**
Total ozone variations at Showa Station [1986, eng] **I-34953**
Antarctic ozone change correlated to the stratospheric temperature field [1986, eng] **I-34955**
Stratospheric cooling over Showa Station [1986, eng] **I-34960**
Ground and balloon observations of stratospheric nitrogen dioxide at Showa Station [1986, eng] **I-34972**
Radiative heating due to stratospheric aerosols over Antarctica [1986, eng] **I-34989**
Meteorological observations at Showa Station in 1981 by JARE [1986, jpn] **I-35209**
Depletion of antarctic ozone [1987, eng] **I-35330**
Variations of atmospheric carbon dioxide concentration at Showa Station [1987, eng] **I-35475**
Relationship between total ozone and stratospheric temperature [1986, eng] **I-35686**
Vertical distributions of atmospheric CF2Cl2, CFCl3 and N2O over Syowa Station in 1983 [1986, eng] **I-35687**
Stratospheric aerosol descent in winter and effects on water vapor budget [1986, eng] **I-35688**
Lidar measurements of antarctic stratospheric aerosols during 1983, 1984 and 1985: effect of volcanic eruption of El Chichón [1987, eng] **I-36059**
Lidar measurement of the antarctic mesospheric sodium layer [1987, eng] **I-36060**
Clouds and high pressure at Showa and Mizuho Stations [1987, eng] **I-36190**
Sodium layer in the mesosphere over Showa Station [1987, eng] **I-36502**
Glaciological research program in east Queen Maud Land, East Antarctica, Part 6, Advance Camp, 1985 [1987, eng] **I-36573**
Meteorological observations at Showa Station, 1982 [1987, eng] **I-36578**
Ozone measurements at Showa Station, 1971-1984 [1987, eng] **I-36592**
Atmospheric methane measured at Showa, 1984 [1987, eng] **I-36599**
MAP observations at Syowa Station in 1985 [1987, eng] **I-36643**
Japanese MAP results in Antarctica [1987, eng] **I-36644**
Lidar cloud studies at Showa Station [1986, eng] **I-36669**
Annual variation of ozone over Showa Station [1986, eng] **I-36670**
Atmospheric carbon dioxide problem [1987, eng] **I-37108**
Relationship between the increase of temperature and variation of ozone level over Antarctica and the Tibetan Plateau in spring [1986, eng] **I-37376**
Neutral wind observations over Showa Station [1988, eng] **I-37440**
JARE-25 oceanographic and marine biological data, Feb. 1984-Jan. 1985 [1987, eng] **J-35700**
Oceanographic data of the 26th Japanese Antarctic Research Expedition from Nov. 1984 to Apr. 1985 [1987, eng] **J-35705**

Oceanographic data of the 27th Japanese Antarctic Research Expedition from Nov. 1985 to Apr. 1986 [1987, eng] J-36581
Aurora observation using the Showa Station 50-MHz Doppler radar [1986, eng] K-34688
Conjugacies of pulsating auroras by all-sky TV observations [1987, eng] K-35596
Observations of auroral LHR noise by the sounding rocket S-310JA-6 [1987, eng] K-35606
Riometer records of 30 MHz cosmic noise at Showa Station, 1985 [1987, eng] K-35701
Records of radio aurora at Showa Station, 1985 [1987, eng] K-35702
Compilatory data processing at Showa Station [1987, eng] K-35747
Monochromatic auroral images at Showa Station [1987, eng] K-35882
Showa Station rocketsonde experiment with aurora [1987, eng] K-36056
Geomagnetic sudden commencements at conjugate stations [1987, eng] K-36061
Narrow-banded ELF emissions over the southern polar region [1987, eng] K-36221
Variations of ELF emissions at conjugate points [1987, eng] K-36336
Geomagnetic conjugacy of 30-kHz band auroral hiss emissions observed at L=6.1 [1987, eng] K-36337
Upper atmosphere physics data, Syowa Station, 1985 [1987, eng] K-36574
Aurora observations at Syowa Station in 1984 [1985, jpn] K-36621
Rocket shooting into aurora australis in 1984 [1985, jpn] K-36622
Temporal variation of the geomagnetic conjugacy in Syowa-Iceland pair [1987, eng] K-36631
Conjugacy of electron auroras observed by all-sky cameras and scanning photometers [1987, eng] K-36632
Conjugacy of rapid motions and small-scale deformations of discrete auroras by all-sky TV observations [1987, eng] K-36633
Spectral characteristics of Pc 3 and Pc 4/5 magnetic pulsation bands observed near L=6 [1984, eng] K-36905
Medium scale traveling ionospheric disturbances observed at Showa Station [1987, eng] K-37145
Rocket sounding of the auroral magnetic field [1988, eng] K-37430
Attitude determination of the antarctic sounding rockets S-310JA-11 and -12 [1988, eng] K-37431
Preliminary analysis of electron density and electric field fluctuations [1988, eng] K-37433
Height variations of auroral hiss observed by S-310JA-11 and -12 rockets [1988, eng] K-37434
Auroral X-ray images over Showa Station [1988, eng] K-37436
Auroral X-ray images using telescopes at balloon altitude [1988, eng] K-37437
Oscillation characteristics of Pi2 in auroral zone: Syowa-Iceland conjugate study [1988, eng] K-37443
Whistler emissions at low altitudes over Antarctica [1988, eng] K-37445
Ionospheric disturbance effect on NNSS satellite positionings at Syowa Station [1988, eng] K-37447
Preliminary results of the multimode FM/CW ionosonde experiment [1988, eng] K-37448
Aeromagnetic survey in the Showa Station region [1986, eng] L-34738
Geophysical data of crustal structure of Mizuho Plateau [1986, eng] L-35037
Longterm underground temperature measurements at Showa Station [1986, eng] L-35038
Aeromagnetic survey around Showa Station [1986, eng] L-35043
Gravity surveys by JARE-27 near Showa Station and Asuka Camp [1986, jpn] L-35207
Seismological bulletin of Showa Station, 1985 [1987, eng] L-35703
Local earthquakes around Showa Station [1987, jpn] L-37481

Signy Island

Factors affecting the breeding performance of antarctic Blue-eyed shags *Phalacrocorax atriceps* [1986, eng] B-34687
Liquid ingestion effect on cold tolerance in mites [1986, eng] B-34743
Harpacticoid n.sp. from South Orkney Is. and redescription of *Idyellopsis typica* [1986, eng] B-34861
Dark respiration of a foliose lichen form Signy Island [1986, eng] B-34903
Two new species of tydeid mite from the maritime Antarctic [1986, eng] B-35088
Size, shape and distribution of organic matter in the Recent antarctic brachiopod *Liothyrella uva* [1987, eng] B-35107
Relationships between Collembola and their environment in a maritime antarctic moss-turf habitat [1985, eng] B-35142
Antarctic marine fungi: a preliminary account [1986, eng] B-35416
Muscle morphology in pelagic and demersal stages of an antarctic teleost [1987, eng] B-35455
Brachiopod *Liothyrella uva* oxygen consumption and nitrogen excretion [1986, eng] B-35623
Nitrogen in two contrasting antarctic bryophyte communities [1987, eng] B-35761
Facial asymmetry in a leopard seal *(Hydrurga leptonyx)* [1987, eng] B-35767
Carbohydrate release during freeze-thaw at Signy Island [1987, eng] B-36043
Cold tolerance in mites [1987, eng] B-36113
Physiology and integumentary structure of *Decolopoda australis* [1987, eng] B-36117
Nitrogen analysis of antarctic peat samples [1987, eng] B-36213
New or noteworthy mosses from Signy Island [1987, eng] B-36214
C:N ratios in two contrasting antarctic peat profiles [1987, eng] B-36733
Checklist of marine diatoms from Signy Island [1987, eng] B-36847
Activity patterns in an antarctic arthropod community [1988, eng] B-37115
Colonization potential of bryophyte propagules in antarctic fellfield soils [1987, eng] B-37365
Protozoa in the microbial communities of maritime antarctic fellfields [1987, eng] B-37366
Limnological studies in the Antarctic Peninsula region [1987, eng] B-37403
Freeze thaw simulations on quartz-micaschist on Signy Island [1986, eng] E-35090
Acclimatization to cold in antarctic scuba divers [1985, eng] H-37021

Siple Coast

Firn studies at upstream B, Siple Coast [1985, eng] F-35194
Measurement of firn structure [1986, eng] F-36030
Navy VXE-6 activities 1984-1985 [1985, eng] G-35574

Siple Station

Ice core record of the C-13/C-12 ratio of atmospheric CO2 in the past two centuries [1986, eng] I-34837
Siple ice core data reveals biospheric CO2 emissions [1987, eng] I-35477
Distributions of electron precipitation events observed at Siple and Palmer Stations [1987, eng] K-35283
Correlated electron and X ray measurements of quiet time electron precipitation: a comparative study of bremsstrahlung production and transport in the atmosphere [1986, eng] K-35405
Model predictions of subionospheric VLF signal perturbations [1986, eng] K-35406
Seasonal variations in auroral absorption [1985, eng] K-35552
Long-term variations in solar radio noise [1985, eng] K-35553
Siple VLF transmitter probes ionosphere and magnetosphere [1985, eng] K-35555
Large-amplitude oscillations of subionospheric VLF signals [1985, eng] K-35556
New type of VLF emission from Siple Station [1985, eng] K-35557
Simultaneous ionospheric data from Siple and Halley Stations [1985, eng] K-35560
Strange new whistlers [1987, eng] K-36044
Magnetospheric lightning as a source of synchronized whistlers [1987, eng] K-36045
Riometer measurements of electron precipitation [1986, eng] K-36193
VLF wave injection, experiments from Siple Station, Antarctica [1987, eng] K-36634
Modulated ionospheric absorption [1987, eng] K-36639
Comparison of gorund-based ionospheric measurements and the USU ionospheric model [1987, eng] K-36647
Statistics of auroral radio absorption at Siple and South Pole [1987, eng] K-36648
Dayside pulsation events near the plasmapause [1986, eng] K-36903
Observations of the VLF quiet band phenomenon [1986, eng] K-36912
Pc 1 pearl-electron interactions [1983, eng] K-36916
VLF emissions triggered by nonducted waves [1981, eng] K-36917
Pc 1 polarization and particle precipitation [1979, eng] K-36919
Magnetic pulsations excited by scc's and si's [1979, eng] K-36920
Satellite observations of discrete VLF emissions at L<4 [1988, eng] K-37166
Structure of VLF whistler mode sideband waves in the magnetosphere [1988, eng] K-37168

Siple Station *(cont.)*
Conjugate ionospheric electric field measurements [1987, eng] **K-37193**

Sones, Mount
Four zircon ages from a 3930 Ma-old granulite from Mount Sones [1986, eng] **E-35590**
FMAS petrogenetic grids in the granulite facies from Enderby Land [1986, eng] **E-35591**

Sör Rondane Mountains
Geology of the western Sör Rondane Mountains [1986, eng] **E-34778**
JARE-27 field report, Sör Rondane Mountains, 1986 [1986, jpn] **E-35211**
Geological survey of the Sör Rondane Mountains in 1984/1985 [1985, jpn] **E-36623**
Geology of the central Sör Rondane Mountains [1987, eng] **E-36712**
Gneisses from the western Sör Rondane Mountains [1987, eng] **E-36713**
Kyanite from the western Sör Rondane Mountains [1987, eng] **E-36714**
Debris-mantled rectilinear slopes of Sör Rondane Mountains [1987, eng] **E-36716**
Activities of the JARE 28 field party in the Sör Rondane Mountains [1987, jpn] **E-37483**
Automatic weather station at Asuka Camp [1987, eng] **I-36602**
Geochronology and paleomagnetism of rocks in the Sör Rondane Mountains [1987, eng] **L-36715**

South Atlantic Ocean
Fish productivity in the atlantic neritic zone [1986, rus] **B-34680**
Records of beaked whales (Ziphiidae) from the western South Atlantic [1986, eng] **B-34765**
Marine birds in South Atlantic Ocean in late autumn [1986, eng] **B-34799**
Larvae of *Mancopsetta maculata* from southwestern Atlantic [1986, eng] **B-35412**
Distribution of eggs and larvae of Myctophidae in the South Atlantic [1986, eng] **B-35753**
Nutrients and chlorophyll *a* surface distribution between 90W and 20E [1987, eng] **B-36577**
Transfer functions between diatom assemblages and surface hydrology in the southern ocean [1987, eng] **B-36689**
Postlarval fish distribution in South Atlantic Ocean [1987, spa] **B-36729**
Feeding of deepsea fishes of the family Bathylagidae [1985, eng] **B-36913**
Biology of the antarctic euphausiid *Thysanoessa macrura* G.O. Sars from the Atlantic sector of the Antarctic [1987, rus] **B-36945**
Chlorophyll studies in the southwestern Atlantic Ocean [1987, rus] **B-37225**
South Atlantic Ocean and adjacent antarctic continental margin [1986, eng] **E-34898**
Porphyrin geochemistry of Atlantic Jurassic-Cretaceous black shales [1986, eng] **E-35759**
Southern ocean drilling: the South Atlantic and Indian Ocean sectors [1987, eng] **E-35776**
Clay mineral associations and structural evolution of the South Atlantic: Jurassic to Eocene [1987, eng] **E-36799**
Atlantic Ocean [1988, rus] **E-37520**
Winter observations of iceberg frequencies and sizes in the South Atlantic Ocean [1988, eng] **F-37326**
Meteorological forecasting for ecological monitoring in the western Atlantic sector of the Antarctic [1987, rus] **I-36932**
Large-scale dynamics of the subantarctic atmosphere [1986, rus] **I-37230**
Physical and chemical data for the South Atlantic Ocean [1985, eng] **J-35065**
Benthic foraminifera near the polar front, southwest Atlantic [1987, eng] **J-35452**
Nannosestone in coastal surface currents of South America and South Atlantic [1987, eng] **J-35757**
Surface thermal fronts in the Atlantic sector of the southern ocean [1988, eng] **J-37141**
Cosmic ray latitude surveys in the Atlantic Ocean area [1987, eng] **K-37184**

South Bay
Predation upon *Laternula elliptica* in South Bay [1986, eng] **B-34662**

South Georgia
South Georgia: a bibliography [1982, eng] **A-37081**
Fish stock in the Scotia arc region during SIBEX [1986, eng] **B-34695**
Variations in krill size in small swarms [1986, eng] **B-34795**
Feeding biology of the brittle star *Astrotoma agassizii* [1986, eng] **B-34797**
Notes on the avifauna of South Georgia [1978, eng] **B-34845**
Distribution and ecology of invertebrates on South Georgia [1985, eng] **B-34867**
Redescription of the *Echinoderes pilosus* (Kinorhyncha: Cyclorhagida) [1986, eng] **B-34891**
Foraging characteristics of king penguins from Saint Andrews Bay, South Georgia [1985, eng] **B-35384**
Antarctic marine fungi: a preliminary account [1986, eng] **B-35416**
Foraging energetics of albatrosses at Bird Island [1987, eng] **B-35473**
Taxonomy and geographic distribution of *Grimmia andreaeopsis* [1986, eng] **B-35605**
Lipid content and composition of some midwater crustaceans from the southern ocean [1986, eng] **B-35622**
Seabirds as predators on marine resources, especially krill, at South Georgia [1987, eng] **B-36051**
Species and sexual isolating mechanisms in sibling species of giant petrels *Macronectes* [1987, eng] **B-36122**
Range expansion of reindeer on South Georgia [1987, eng] **B-36215**
Right whale sightings around South Georgia [1987, eng] **B-36216**
Breeding of the white-chinned petrel *Procellaria aequinoctialis* [1987, eng] **B-36328**
Reindeer influence on South Georgia vegetation [1987, eng] **B-36830**
Agrotis ipsilon (Lepidoptera) at South Georgia [1987, eng] **B-36845**
Cephalopod prey of the wandering albatross [1987, eng] **B-36864**
Fish prey of Wilson's storm petrel *Oceanites oceanicus* at South Georgia [1988, eng] **B-37114**
Brown-hooded gull *Larus maculipennis:* first record for South Georgia [1988, eng] **B-37117**
Mark-recapture estimates of breeding population size in storm petrel at South Georgia [1988, eng] **B-37124**
Population size and status of the southern elephant seal *(Mirounga leonina)* at South Georgia, 1951-1985 [1988, eng] **B-37128**
Diving patterns related to diet in two South Georgia penguins [1988, eng] **B-37137**
Dinoflagellates from water around South Georgia [1987, eng] **B-37155**
Antarctic fur seal *Arctocephalus gazella* [1987, eng] **B-37299**
Skull morphometrics of male antarctic and subantarctic fur seals *Arctocephalus gazella* and *A. tropicalis,* and their interspecific hybrids [1987, eng] **B-37305**
Speaking of South Georgia [1987, swe] **B-37343**
Ecophysiology of intertidal mites at South Georgia [1987, eng] **B-37357**
Sea birds of antarctic maritime regions, 20W to 80W [1984, eng] **B-37449**
Netherlands South Georgia Scientific Expedition [1988, dut] **D-37503**
Geochemistry and tectonic setting of gabbroic rocks in the Scotia Arc Basin [1986, eng] **E-35093**
Glacial history of the Antarctic Peninsula and South Georgia [1986, eng] **E-35255**
Radiocarbon dates of peat near Nordenskjöld Glacier, South Georgia [1987, eng] **E-36207**
Beach changes from retreating glacier ice in South Georgia [1986, eng] **F-34893**
Stable isotopes and debris in basal glacier ice, South Georgia [1987, eng] **F-36908**
Studies of standing-wave geomagnetic pulsations in the magnetosphere [1987, eng] **K-36843**
Measurement of declination at South Georgia, 1700-1984 [1987, eng] **L-35710**
Geomagnetic repeat measurements at Grytviken, Apr. 1987 [1988, eng] **L-37116**

South Orkney Islands
Fatty acids and sterols of the tunicate *Salpa thompsoni* [1986, eng] **B-35607**
Chaetognaths, polychaetes and amphipods in waters off South Orkney Is. [1987, spa] **B-36728**
Diatoms of the South Orkney Islands [1987, eng] **B-37391**
Planktonic copepods of waters near the South Orkney Islands [1987, eng] **B-37392**
Zonophryxus quinquedens Barnard (Isopoda, Epicaridae, Dajidae) in South Orkney Islands waters [1987, eng] **B-37395**
Factors regulating the distribution patterns of seabirds [1987, eng] **B-37398**
Preliminary results from the *USCGC Glacier* 1985 cruise [1985, eng] **E-35335**

Thermobaric and ice conditions, South Orkney region [1986, eng] I-35824
Biogenic sediments in Atlantic sector antarctic waters [1987, eng] J-35451

South Pacific Ocean
Pelagic shrimp of the family Oplophoridae from Pacific southern ocean [1986, eng] B-34798
Composition and distribution of planktonic infusorians [1986, eng] B-35020
New records for *Physetocaris microphthalma* Chace (Decapoda, Caridea, Physetocarididae) from the South Pacific [1985, eng] B-37158
Energy sources for recruitment of a subantarctic copepod [1987, eng] B-37286
Revised history of early Tertiary plate motion in the south-west Pacific [1987, eng] E-35749
Geodynamics of the South Antilles region [1986, eng] E-36178
Pacific Ocean [1988, rus] E-37522
On intensification of a frontal eddy embedded in a mean flow with a temperature gradient [1986, eng] J-34751

South Pole
Walk to the Pole: to the heart of Antarctica in the footsteps of Scott [1987, eng] A-36996
Nitrate variability in South Pole and Ross Ice Shelf snow and firn [1985, eng] F-35196
Nitrate deposition in Antarctica; temporal and spatial variations [1986, eng] F-35469
Firn densification by grain-boundary sliding: a first model [1987, eng] F-36773
Physiological report [1987, eng] H-36997
Total ozone decrease at South Pole, 1964-1985 [1986, eng] I-34967
Trend of bromochlorodifluoromethane and the concentrations of other bromine-containing gases at the South Pole [1985, eng] I-35537
Chemical tests of antarctic hygroscopic aerosols [1985, eng] I-35539
Solo flights into the ozone hole reveal its causes [1988, eng] I-36875
South Pole telescope [1985, eng] K-35547
Global characteristics of northward IMF-associated (NBZ) field-aligned currents [1987, eng] K-36127
Long-period geomagnetic pulsations in high-latitude magnetically conjugate regions [1986, eng] K-36264
Conjugate ionospheric electric field measurements [1987, eng] K-37193
Study of long-period Earth motions at the South Pole [1987, spa] L-36370

South Sandwich Islands
Anhydrous P-T phase relations of near-primary high-alumina basalt from the South Sandwich Islands [1986, eng] E-36691

South Shetland Islands
British sealing on New South Shetland, 1819-1826. Pts. 1 and 2 [1984, eng] A-37490
Parasite counts in a South Shetlands limpet [1986, ger] B-34879
Bubulcus ibis and *Eudyptes chrysolophus* from South Shetland Islands [1986, spa] B-35266
Krill chitin and metal transport in sea water [1986, eng] B-35585
Krill population comparisons, 1981 and 1984, near South Shetland Is. [1987, eng] B-36225
Biomass and phytoplankton composition in Scotia Sea and South Shetland Islands [1987, spa] B-36361
Biomass estimate of some species captured during the *Antártida 8611* cruise [1987, spa] B-36381
Macrobenthos of the Scotia Arc archipelago found during the *Antártida 8611* cruise [1987, spa] B-36385
Catalog of lichens from material collected on South Shetland Islands during the *Antartic-86* expedition [1987, spa] B-36388
Recovery of banded seabirds from South Shetland Is. [1987, spa] B-37043
Coastal lichens in the South Shetland Islands [1987, eng] B-37407
In Scotia Sea [1987, rus] D-36475
Development of the South Shetland Islands and the Antarctic Peninsula [1986, eng] E-34732
Glacial history of the Antarctic Peninsula and South Georgia [1986, eng] E-35255
Preliminary results from the *USCGC Glacier* 1985 cruise [1985, eng] E-35335
History of glaciation and topography of South Shetland Is. [1986, ger] E-36988
Dynamics and development of arctic and antarctic coasts [1985, ger] E-37007
Antartic' 86 Expedition. Scientific results [1987, spa] J-36355

Southern Thule
Britain's antarctic dimension [1983, eng] M-35236

Sulzberger Bay
Basal sediment ages of 1983 piston cores [1985, eng] E-35355

Tabarin Peninsula
Cretaceous sedimentary sequence of the Troilo Nunatak [1986, spa] E-35861

Takahe, Mount
Reinterpretation of glaciovolcanic interactions in Marie Byrd Land [1985, eng] E-35190
Weather and solar radiation measurements at Mount Takahe and Mount Murphy, West Antarctica [1985, eng] I-35531

Taylor Valley
Magnetic model studies of volcanic cones in the ice-free valleys of southern Victoria Land [1985, eng] E-35162
Dry valleys/McMurdo Sound magnetostratigraphy and sedimentology project: a progress report [1985, eng] E-35163
Radiocarbon chronology of the last glaciation in McMurdo Sound [1985, eng] E-35191
Differential weathering effects and mechanisms [1985, eng] E-37236

Terra Firma Islands
Deschampsia antarctica and *Colobanthus quitensis* in the Terra Firma Islands [1987, eng] B-35316

Terra Nova Bay
First expedition of the Italian Antarctic Research Program: geomorphological observations [1986, ita] E-36580
Boundary layer studies at Terra Nova Bay [1986, eng] I-34672
Katabatic wind interaction with Inexpressible Island, Terra Nova Bay [1985, eng] I-35532
Modern sediments of the Terra Nova Bay polynya [1985, eng] J-35348

Thiel Mountains
Sedimentary rocks of the Ellsworth-Thiel Mountains ridge and their regional equivalents [1987, eng] E-36209
Cambrian-Ordovician magmatism in the Thiel Mountains [1988, eng] E-37247

Thurston Island
Igneous rock composition at Thurston Island [1987, eng] E-36333

Thwaites Glacier
Coastline changes revealed by satellite imagery [1987, eng] F-35774

Tonagh Island
Pyroxene granulites on Tonagh Island [1987, eng] E-36042

Tourmaline Plateau
Zoning patterns of tourmalines in northern Victoria Land [1987, eng] E-37315

Transantarctic Mountains
Uplift and subsidence in the Transantarctic Mountains [1986, eng] E-34860
South Atlantic Ocean and adjacent antarctic continental margin [1986, eng] E-34898
Fossil Permian moss from the Transantarctic Mountains [1986, eng] E-35008
Rates of geomorphic modification in ice-free areas, southern Victoria Land, Antarctica [1985, eng] E-35165
Triassic Gondwana sequences in the Transantarctic Mountains and Tasmania [1987, eng] E-35807
Radioactive minerals and the pre-Beacon erosion surface [1987, eng] E-35808
Uplift history of the Transantarctic Mountains [1987, eng] E-36312
Beacon Supergroup and Ferrar Group in the Beardmore Glacier area [1986, eng] E-36517
Triassic reptile *Prolacerta* in Antarctica [1987, eng] E-36556
Pliocene *Nothofagus* wood from the Transantarctic Mountains [1987, eng] E-36774
Geological characteristics and tectonic nature of the Transantarctic Mountains [1986, chi] E-37095
Modeling magnetic and gravity effects of the Transantarctic Mountains [1985, eng] L-35154

Trinity Peninsula
Marine geology of NW Weddell Sea and Trinity Peninsula [1985, eng] E-35336
Sandstone detrital modes and basinal setting of the Trinity Peninsula Group, Northern Graham Land, Antarctic Peninsula: a preliminary survey [1987, eng] E-35798
U-Pb data of detrital zircons of Trinity Peninsula [1987, eng] E-37319

Unter-See, Lake
Algological study in Schirmacher and Unter-See lakes [1987, ger] B-36454

Unter-See, Lake *(cont.)*
Studies of mountain lakes in the Unter-See region [1987, rus] **E-37068**
Lacustrine ice in the Schirmacher and Unter-See ponds in Antarctica [1987, rus] **F-36627**
Unusual moraine [1987, rus] **F-37079**
Vanda, Lake
Photosynthate distribution by microplankton in permanently ice-covered antarctic desert lakes [1987, eng] **B-35325**
Bacterial cell size and biomass in Lake Vanda [1987, eng] **B-36576**
Further study on the vertical distribution of organic constituents in an antarctic lake, Lake Vanda [1987, eng] **B-37467**
On the flooding of Vanda Station [1987, eng] **E-36270**
Vestfold Hills
Hydrocarbons in benthic algae from Vestfold Hills [1987, eng] **B-35464**
Halomonas subglaciescola, a new species of halotolerant bacteria isolated from Antarctica [1987, eng] **B-35466**
Marine fauna in shallow coastal waters near the Rauer Islands [1987, eng] **B-36764**
Vertical distribution of an antarctic copepod in Ace Lake, Vestfold Hills [1987, eng] **B-36881**
Behavior and tagging of male southern elephant seals from the Vestfold Hills area [1985, eng] **B-37411**
Early Pliocene Vestfold Hills marine sediments [1986, eng] **E-35259**
Limnology of Organic Lake, Vestfold Hills [1987, eng] **E-36679**
Ar-40/Ar-39 age of a basic rock from East Antarctica [1984, ger] **E-36770**
Regional climate of two antarctic oases [1986, eng] **I-36668**
Victoria Land
Dry Valleys bibliography: supplement to vol.2 [1986, eng] **A-37196**
Antarctic stream ecosystems: variability in environmental properties and algal community structure [1986, eng] **B-34791**
Lichen colonies in dry valley rocks [1983, ger] **B-34844**
Algal mats from dim, frigid antarctic lakes [1981, eng] **B-35010**
Field studies of antarctic cryptoendolithic microbial ecosystems, 1984-1985 [1985, eng] **B-35523**
Method for the continuous monitoring of snow: application to the cryptoendolithic microbial community of Antarctica [1985, eng] **B-35524**
Effects of light intensity on the cryptoendolithic microbiota [1985, eng] **B-35525**
Microorganisms in soil samples from Linnaeus Terrace, southern Victoria Land: preliminary observations [1985, eng] **B-35526**
Floristic survey of algae at four locations in northern Victoria Land [1987, eng] **B-36268**
Epilithic lichens in Beacon sandstone formation, Victoria Land [1987, eng] **B-36628**
Protection of terrestrial plants and animals in the Ross Sea region [1987, eng] **B-36858**
Landsat data for photogeology in southern Victoria Land [1985, eng] **C-35569**
Clay-mineraloid weathering products in antarctic meteorites [1986, eng] **E-34759**
Li, Be, B, and Sr in margarite and paragonite from Antarctica [1986, eng] **E-35108**
Granitoids of northern Victoria Land [1987, eng] **E-35115**
Perennial N2 supersaturation in an antarctic lake [1987, eng] **E-35128**
Dating till by paleomagnetism: Allan Hills, southern Victoria Land [1985, eng] **E-35159**
Rates of geomorphic modification in ice-free areas, southern Victoria Land, Antarctica [1985, eng] **E-35165**
Alteration of antarctic hyaloclastites [1985, eng] **E-35173**
Geochronology of Swanson Formation of Marie Byrd Land [1986, eng] **E-35288**
Trace elements and weathering of H chondrites [1986, eng] **E-35418**
Granitoids of northern Victoria Land [1984, eng] **E-35422**
Weathering effects compared for antarctic and non-antarctic chondrites [1987, eng] **E-35450**
Eolian dunes in Victoria Land [1985, ger] **E-35495**
Handler Formation, a new unit of the Robertson Bay Group [1987, eng] **E-35782**
Radiometric ages of pre-Mesozoic rocks from Victoria Land [1987, eng] **E-35783**
Review of the problems important for interpretation of the Cambro-Ordovician paleogeography of northern Victoria Land (Antarctica), Tasmania, and New Zealand [1987, eng] **E-35784**
Paleozoic magmatism and tectonics of northern Victoria Land [1987, eng] **E-35785**
Radioactive minerals and the pre-Beacon erosion surface [1987, eng] **E-35808**
Geological investigations in northern Victoria Land [1986, eng] **E-35901**
Permian and Triassic fluvial deposits in northern Victoria Land [1986, eng] **E-35910**
Uranium resource potential of northern Victoria Land [1986, eng] **E-35919**
Suspect terranes and Cambrian tectonics in northern Victoria Land, Antarctica [1985, eng] **E-35985**
Uplift history of the Transantarctic Mountains [1987, eng] **E-36312**
Geotectonics of north Victoria Land granitoids [1987, eng] **E-36332**
Metasediments and orthogneisses from southern Victoria Land [1987, eng] **E-36860**
Petrological evolution of basement granitoids, southern Victoria Land [1987, eng] **E-36861**
Comment on geochronological studies of the Swanson Formation of Marie Byrd Land [1987, eng] **E-36972**
Paleozoic accretion at the paleopacific margin of Antarctica [1987, eng] **E-37314**
Metamorphic processes in the Transantarctic crystalline basement [1987, eng] **E-37316**
Extreme depletion of O-18 in clasts from Victoria Land [1988, eng] **F-37219**
Victoria Land raised beaches, eustasy and glacial isostasy, 18,000 yr BP [1986, eng] **J-35254**
Victoria Lower Glacier
Victoria Lower Glacier and Ross Sea glaciation, Dry Valleys [1987, eng] **F-36906**
Victoria Valley
Study of heterotrophic microorganisms collected in Victoria Valley and Ross Island nearshore, Antarctica [1986, chi] **B-35884**
Vostok Station
Pseudomonas genus of bacteria isolated from Antarctic ice sheets [1986, rus] **B-34889**
Ecological peculiarities of mycelial fungi from antarctic ice [1987, rus] **B-36944**
Sulphuric acid in the antarctic ice sheet [1987, eng] **E-36046**
Tephra in ice cores from Vostok and Amundsen-Scott stations [1987, eng] **E-36506**
Aerosol concentrations over the last climatic cycle (160 kyr) from an antarctic ice core [1987, eng] **F-35127**
International antarctic glaciological program activities at South Pole Station and Vostok [1985, eng] **F-35200**
Long-term climatic changes indicated by crystal growth in polar ice [1987, eng] **F-35244**
Two Be-10 peak depositions in ice during last glaciation [1987, eng] **F-35322**
Preliminary data on changes of lead concentrations in antarctic ice from 155,000 to 26,000 years BP [1987, eng] **F-36103**
Mechanical behavior of anisotropic polar ice [1987, eng] **F-36286**
Antarctic cornucopia [1987, eng] **F-36406**
Ice core links CO2 to climate [1987, eng] **F-36407**
Vostok ice core climate record [1987, eng] **F-36408**
Vostok ice core provides 160,000-year record of atmospheric CO2 [1987, eng] **F-36409**
Climatic response to atmospheric CO2 from Vostok ice core record [1987, eng] **F-36410**
10-Be in polar ice [1987, eng] **F-36504**
Ice rheology parameters from long term borehole studies at Vostok Station [1987, rus] **F-36938**
Orbital forcing and the Vostok ice core [1988, eng] **F-37417**
Vostok (Antarctica) ice core: atmospheric chemistry changes over the last climatic cycle (160,000 years) [1988, eng] **F-37497**
Adaptation and its prognosis in people with different levels of hypoxic stability at high altitudes of Antarctica [1984, rus] **H-37004**
Homogeneity of series of mean monthly wind speed data for Soviet antarctic stations [1981, rus] **I-34933**
Surface wind velocity profiles in Antarctica [1981, rus] **I-34934**
Oxygen isotope study of thermal conditions in Central Antarctica in last 150,000 years [1987, rus] **I-36624**
Experimental data on aerosol optical thickness in Antarctica in summer 1984/85 [1987, eng] **I-36863**
Low humidity and transparency at Vostok Station [1986, eng] **I-37160**
Diagnostics of the dayside cusp with a northern direction of interplanetary field [1983, eng] **K-35303**
Applicability of VLF phase observations on transpolar paths to observations of polar cap absorption [1987, rus] **K-36476**

Interstellar shock waves and Be-10 from ice cores [1987, eng] K-36586
Features of the polar cap aurorae in the southern polar region [1988, eng] K-37512

Weddell Sea
Polymorphism and distribution of *Ceratoserolis trilobitoides* in Weddell Sea [1986, eng] B-34661
Tintinnine population at the Weddell Sea ice edge [1986, eng] B-34821
Sinking rates of phytoplankton assemblages at the Weddell Sea ice edge [1986, eng] B-34822
Microheterotrophs in the ice-edge zone: an AMERIEZ study [1985, eng] B-35363
Macroplankton zoogeography and community analysis [1987, ger] B-35851
Morphological variation in antarctic diatom, genetic analysis [1987, eng] B-35855
Distribution of meso- and macrozooplankton in Weddell Sea surface water [1987, ger] B-35856
Winter diatom distribution in the Weddell Sea [1987, eng] B-35930
Density nutrients and phytoplankton in the ice edge zone of the Weddell-Scotia Sea [1987, eng] B-36009
Archaeomonad (Chrysophyta) cysts: ecological and paleoecological significance [1986, eng] B-36114
Redescription of *Aegires (Anaegires) albus* and synonymy with *A. protectus* [1987, eng] B-36119
Drescheriella glacialis n. gen., n. sp. in sea ice [1987, eng] B-36223
Pelagic polychaetes collected during the 1st Brazilian Antarctic Expedition [1986, por] B-36241
Nutrients and chlorophyll *a* surface distribution between 90W and 20E [1987, eng] B-36577
Zooplankton communities in the southern Weddell Sea (Antarctica) [1988, eng] B-36822
Age and growth of antarctic Euphausiacea (Crustacea) under natural conditions [1987, eng] B-36992
Burial of antarctic microalgal debris in bioturbated deep-sea sediments [1987, eng] B-37050
Composition and distribution of phytoplankton near Bouvet Island [1987, eng] B-37062
Seasonal variability of zooplankton in the southern Weddell Sea [1987, eng] B-37085
Austral spring microalgae across the Weddell Sea ice edge: spatial relationships found along a northward transect during AMERIEZ 83 [1988, eng] B-37161
Krill in ice edge zone of Weddell Sea in spring 1983 [1988, eng] B-37162
Distribution and ecology of sea cucumbers in the Weddell Sea [1988, ger] B-37235
Growth rates of antarctic marine phytoplankton in the Weddell Sea [1987, eng] B-37289
Winter expedition of FS *Polarstern* to the Antarctic (ANT V/1-3) [1987, ger] D-36984
Expedition ANTARKTIS-IV of RV *Polarstern* 1985/86. Report of Legs ANT-1V/3-4 [1987, ger] D-37493
High latitude drilling in the ocean drilling program [1986, eng] E-34677
Morphology and sediment processes and supply from Weddell Sea floor [1986, eng] E-34728
South Atlantic Ocean and adjacent antarctic continental margin [1986, eng] E-34898
Ocean Drilling Program after 1 year of drilling operations [1986, eng] E-35024
Marine geology of NW Weddell Sea and Trinity Peninsula [1985, eng] E-35336
Glacial history of Antarctica. Ocean Drilling Program Leg 113 shipboard scientific party [1987, eng] E-35769
Southern ocean drilling: the South Atlantic and Indian Ocean sectors [1987, eng] E-35776
Ocean drilling details steps to an icy world [1987, eng] E-36217
Till and glacial-marine sand grain from the Weddell and Ross seas [1987, eng] E-36394
Geotechnical properties of antarctic deep sea sediments [1985, eng] E-36444
Preliminary assessment of the hydrocarbon potential of the Larsen Basin, Antarctica [1988, eng] E-37110
Opal sediments and fluorine chemistry in antarctic waters [1987, eng] E-37322
Preliminary results of ODP Leg 113 of *Joides-Resolution* in the Weddell Sea: history of antarctic glaciation [1988, fre] E-37339
Weddell-Scotia sea ice margin, Oct. 1984 [1986, eng] F-34750
Biogenic and mineral inclusions in a green iceberg from the Weddell Sea [1987, eng] F-34919
Ice dynamics in the Weddell Sea, 1980 [1986, rus] F-35219
Salinity, alkalinity, and calcium of the Weddell Sea ice [1985, eng] F-35353
Ice dynamics [1986, eng] F-35393
Quantitative estimates of the mass flux and ice movement along the ice edges in the eastern and southern Weddell Sea [1987, eng] F-35502
Role of standing waves in dynamics of Weddell Sea ice sheet [1986, eng] F-35715
Soviet-American expedition "Weddell-POLEX-81", review [1986, rus] F-35934
Shuttle Imaging Radar B Weddell Sea ice observations [1987, eng] F-36008
Evolution of under-water sides of ice shelves and icebergs [1987, eng] F-36076
Ice conditions in Weddell Sea in the spring and summer of 1977-1978 [1986, rus] F-36232
Unloading operations at Druzhnaya Base in 1977-1978 [1986, rus] F-36233
Response of climate-driven sea ice model to ocean heat flux [1982, eng] F-36511
Ice sheet morphology and bottom topography of southern Weddell Sea [1987, rus] F-36935
Physical and structural characteristics of Weddell Sea pack ice [1987, eng] F-36966
Winter Weddell Sea Project 1986 [1988, eng] F-36977
Nitrate trace determinations in snow and firn cores from Weddell Sea [1988, eng] F-37496
Acclimatization to cold in antarctic scuba divers [1985, eng] H-37021
Meso- and macroscale air-sea interaction processes in the South Atlantic Ocean [1986, rus] I-35941
Small-scale interaction between atmosphere and ocean at Maud Rise [1986, rus] I-35942
Meteorological conditions at Druzhnaya Base in summer 1980 [1986, rus] I-36197
Antarctic sea ice—atmosphere signal of the southern oscillation [1986, eng] I-36678
Atmospheric energetics in polar regions [1987, rus] I-36950
Water masses and currents off the Antarctic Peninsula [1986, eng] J-34690
Heat transfer in the antarctic zone of the southern ocean [1986, eng] J-34852
Distribution and concentration of polynucleate hydrocarbons in the Weddell Sea [1986, spa] J-34926
Physical and chemical data for the South Atlantic Ocean [1985, eng] J-35065
Heat-flow measurements in the Jane Basin, a back-arc basin, northern Weddell Sea [1985, eng] J-35337
Use of acid-balance values to trace water-mass in the Weddell Sea [1985, eng] J-35352
Atlantic long lines, leg II, Cape Town to Punta Arenas [1985, eng] J-35354
Circulation and mixing in ice-covered waters [1986, eng] J-35394
Water masses and currents of the southern ocean [1987, eng] J-35684
Diurnal shelf waves in the southern Weddell Sea [1987, eng] J-35854
Polynucleate hydrocarbon concentrations from oil spilled in seawater [1986, spa] J-35858
Physical and chemical oceanographic work [1987, spa] J-35888
Soviet-American field experiment "Weddell-POLEX-81" [1986, rus] J-35932
Thermohaline water stratification in the southern ocean from ice cover data [1986, rus] J-35933
Water mass structure in the area of Maud Rise in Oct. 1981 [1986, rus] J-35936
Sound velocity variability at Maud Rise [1986, rus] J-35943
Helium-3 balance of the upper layers of the northwest Weddell Sea [1987, eng] J-36101
Weddell Sea boundary in eastern Atlantic [1987, eng] J-36532
Mixing and bottom water formation in the shelf break region of the southern Weddell Sea [1987, eng] J-36991
Numerical study of the response of the southern ocean and its sea ice to a CO2-induced atmospheric warming [1986, eng] J-37309
Hydrographic observations in the northwestern Weddell Sea, Mar. 1986 [1988, eng] J-37373

West Antarctica
Trophic level of *Pleuragramma antarcticum* in west antarctic waters [1986, eng] **B-36829**
Ichthyoplankton studies in West Antarctica [1987, rus] **B-37228**
Structural and tectonic history of the Ellsworth Mountains—Thiel Mountains ridge [1987, eng] **E-35790**
Gabbroic and diabasic rocks from West Antarctica [1987, eng] **E-35791**
Granitic rocks from Ellsworth-Whitmore Mountains crustal block and the Thiel Mountains [1987, eng] **E-35792**
Rb-Sr geochronology of the Haag Nunataks and Mesozoic granitoids of West Antarctica [1987, eng] **E-35793**
Paleomagnetism and tectonics of Ellsworth-Whitmore Mountains crustal block [1987, eng] **E-35794**
Ellsworth-Whitmore Mountains crustal block and tectonics of West Antarctica [1987, eng] **E-35795**
Pacific margin of Antarctica: terranes within terranes within terranes [1985, eng] **E-35986**
